> Is it possible to use a MegaST keyboard
> in place of a TT keyboard. Whats the
> difference (if any?).

Yes, they will interchange just fine.

The big difference is construction. The TT keyboard is more susecptible to being destroyed by static electricity. And it's more cheaply built. Been there and done that 2 or 3 times. I used my Mega keyboard while waiting for parts.

The Mega keyboard is a tank. The keycaps are larger than standard so a lot of people had problems with mistyping letters. Used real switches, tho'. TT and newer keyboards have membrane keyboards. The only difference between the TT and MegaSTE keyboards is color.

The mega keyboard was actually my favorite.

Ken

5. MultiTOS

Newsgroup: comp.sys.atari.st

Message-ID: <B91DBD62.10D9D%brooksie1@shaw.ca>
Source record: 34462

Well it comes up fast from the demo program but nothing runs from my old applications. Of course I could be missing something because I don't read German. Tried IMGCOPY.PRG and got error messages with a 68000 exception of some sort. Tried Calamus too but got a bus error #2. Tried Papyrus 5 and got an error.

Any hints? Any idea when an English version will be available?

Thanks!!!

Keith

I wonder why some printers do not work at all without this signals. Just for receiving data and printing I do not see why a bidirectional connection and/or additional signals are mandatory. With scanners this may be different, don't know.

Sorry no. Try to ask ash by email. Iï¿½m sure they talk english.
Same as here. This demo isnï¿½t usable well. Serial mac port also is
blocked as on any other relase. Screen drawing does not work well.
Some fragments after close magic mac x.

That all tell me to wait for a final release and to wait for reports
from other users.

The second Atari manual states that 70% of professional chess
players used Atari STs. Perhaps they used that one?

Oxford chess, published originally by the ST Club, will run on a
bare Falcon. When I try it on my usual setup (MagiC 6.01, NVDI 5)
double-clicking the prg file does nothing at all! Verrrry strange.

Unfortunately the rather fun Battle chess won't run, but bombs :-(

Hi;

I occasionaly get a fit to engage on a search for the same thing-
so far without much success. I -know- for sure that there was a
command-line interpeter that worked as accessorry, opened a window, and was,
among other things, able to launch even GEM programs. It was mentioned in
this newsgroup a couple of weeks ago- the name was Command! (with ! at the
end, as opposed to a more ordinary command-line interpreter named COMMAND)
and apparently it was a commercial product and can not be found on the
Net, except for a demo which can start only TOS (noGEM) programs. I also
found an accessory (freeware) called RUNPRG which can launch TOS programs,
but has problems when one tries to start a GEM application- and the author
warned indeed that there would be problems in that case. As the C source code
for RUNPRG is available, perhaps it could be upgraded, by someone
knowledgeable, to launching GEM applications as well.

I suppose that Command! (i.e. a full command-line interpreter) would be
the most flexible solution, because, beside launching programs, it would
be able to perform certain other operations on its own. SO, if you find
somewhere a full version- let me know where it is :)

Cu;

Indeed, it is probably the one part that will far outlive any other component
of any Atari computer. It weights about 1.5kg and is extremely rigid
and well built in all aspects mechanical. It was built by Cherry-
a reputed manufacturer at that time.

>The keycaps are larger than standard so a lot of people had
>problems with mistyping letters.

As one gets reasonably skilled in typing, that problem practically disappears.

>Used real switches, tho'. TT and newer keyboards have membrane keyboards.
>The mega keyboard was actually my favorite.

Mine too. I know that some people prefer TT ones, though (each to his own
taste), but for me, MegaST keyboard is one of the best I have worked on.

The kernel (MiNT) is now open-source freeware and named FreeMiNT. For the
AES part of it (AES 4.x GEM.SYS) there are much better alternatives now:
XaAES (freeware) and N.AES (commercial).

Take a look at

http://www.freemint.de
http://sparemint.atari.org
http://xaaes.atari.org
http://www.woller.com

The Easymint installation package is also something to consider, I just
can't remember the URL right now. and don't forget to get the THiNG
desktop replacement.

It definitely runs on a TT, though. I have it next to me right now
fighting against itself in ST low on a VGA monitor with cache on.

Sound and everything seems OK. I thought a Falcon would be more
compatible compared to a TT but maybe this game is different...

A complete Easymint installation isn't such a good idea in that case.
But a small MiNT/XaAES setup should be possible.

29. FS: Dr. T's Copyist DTP for Atari software

Newsgroup: comp.sys.atari.st
Date: 2002-06-02 03:45:28 UTC
From: C <chris.rupert@sympatico.ca>
Message-ID: <5SdK8.15724$t97.2846079@news20.bellglobal.com>
Source record: 34487

I'm selling 2 versions of Dr.T's Copyist Professional DTP software. V1.6 (3 discs) has a problem with the backup disc; as a result, I ordered the upgrade v1.7 (3 discs), which has more features. This is a great software package with very few automatic features, which means you can put practically anything on your score that you want. I used this software for years on my Atari before going to a PC version. Some features include: importing and trascription from a sequencer, user definable fonts, user customizable macros, mouse and keyboard entering of symbols, and much more! I am including the 6 original discs plus some backup copies I made on floppy, as well as both manuals and a cardboard wall poster outlining many of the commands for reference.

I no longer have an Atari computer, so (unfortunately) I have no way of testing these discs to see if they still work. This package is therefore being sold as is, with no guarantees (sorry!).

Best offer.

I can put you in touch of someone who wrote a great tutorial on
assembly programming on the Atari ST, describing things like
triple buffering, sprites, sound etc. Designed for programming
demos and games, but it covers the basics as well.

Well I've not used CAB 2.7 on my TT in a few months and now when I do a large number of Web Sites I used to hit now give me "File Not Found" in CAB. I'm using CAB2.7 with the included IConnect and I'm running MagiC6 on my TT. I emptied the cache and still I get the message. One of the sites in question is www.apple.com Most of the time I can not reach this site but on the rare times I can I get the main page but can't click on any other pages like OSX or the iBook pages. Anybody have any ideas?

Works fine here. Just tested http://www.apple.com/ and surfed in to the
iBook pages etc no errors whatsover and they do not seem to rely too
heavily on Javascript either.

This is with CAB but STinG. I suppose you have some DNS problems. Don't
know what resources the IConnect setup has but first check if you can
resolve the hostname www.apple.com to a dotted address.

Nordic Atari Show in Oskarshamn, Sweden 29-30/6!

The annual Nordic Atari Show (NAS) will take place in Oskarshamn this year. Oskarshamn is located on the Swedish east coast close to the great island "ï¿½land". Atari enthusiasts from all over the country and abroad will gather together and participate in or just visit the exhibition.

The show is opened 29/6-30/6 and we welcome anyone to join. Entrance fee is SKR 100 (appr. 10 EUR) for both days.

There will be second hand Atari computers, monitors, software, etc on sell. If you want to sell anything yourself just bring the stuff with you.

We plan to do a lot af networking so bring your Ethernet adapters, nullmodem cables, MIDI cables, etc to join the network with fast Internet access via NAT.

For more info browse to http://www.sak.nu/ and click the "Nordic Atari Show" button. Info in English can be found further down on the page, map included.

I don't have any probs to viste www.apple.com using Cab 2.8 with the
MiNT-net ovl.

Are you sure your settings are still the same? What about the
proxy server? Do you use one? If so do you use the right server and the
right syntax?

Mike,

Just for interest I did a couple of tests with my NE2000 Cartridge Port
adaptor, and seem to be getting between 50 and 60 K/Bytes second
between my STE with internal IDE Drive and my Windows/2000 PC
which is a fairly old AMDK6-350 running a similar card...

Dave.

>Anyone had similar problems ?

Yes there are some problems with 'save as' and other items like for
instance the window name of a (new) empty text window under MiNT.

The author knows about it as I've told him.
The problem I've with 'save as' is that the file selector (doesn't
matter which selector) displays something like this in the path window
d:/qed/ï¿½ï¿½ï¿½ï¿½ [Atari ascii 255 (3 times) + atari ascii 136]
ï¿½ï¿½ï¿½ï¿½ is also displays in the pre-installed extension masks.

To save the file I must first click on the '*' mask so that I can view
all the files in the dir where I want to store the text file.

Apart from that 'save as' does work on my setup (Hades 060/FreeMiNT
1.15.12/N_AES 2.0.0)

HTH,
Martin

Hi Mike,
Try setting all files (that can be set) to "fastload".
14 meg Falcon here and Pagestream 2.2SE pops right up! On advice, I did
the same to all in the Auto folder and now see a faster boot-up!
John

Hallo Adam!

AK>MiNT and FreeMiNT will NOT work with Outside.

Even not with MP disabled?

AK>Keep in mind that Outside and any other vitrual memory manager
AK>requires at least 020 or better.

For Outside and its (former) competitor vram (???) 030 only!

But Joseph having a Falcon, this would be no problem.

My experience with Outside was, that it's virtually unusable on SCSI disks unless the clockpatch is working 100% reliably. No problem with IDE harddisk, though.

From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0206032138460.168-100000@easymint>
Source record: 34422

Just installed an official full version of Papillon 3.04 (German).
I tried to replace the RSC files with the translated english ones from
D&D. But with these resources Papillon quits automatically right after the
appearance of the opening screen. The strange thing is that these same RSC
files worked perfectly with the Papillon 3.04 demo that I tried first.

I have already seen in my RSC editor that translated resource has one
objecttree more than the original German one from my full version. (50
against 49). They are not identical.

I'm lucky to be able to read German, but I prefer English. (Not because of
World War 2 and I'm no socker fanatic either. In fact most Germans are OK,
especially Atarians ;)

What to do to make the English RSC files work with my full version
Papillon 3.04 ?

Martin Tarenskeen

Multitasking on a 4MB ST? Only MagiC! :-) You may try Geneva
and even Geneva with MiNT kernel, but when you will install
MagiC you will never want to use anything else. Never. ;-)

MagiC is great _on standard STs_, because it takes very little
RAM, gives you multitasking and is actually *faster* than TOS.

When I had 1040STE (with 4MB RAM and 20MB hard drive) I used
MagiC 5.2 and was quite happy with it.

But remember that if you have some non-standard hardware
extensions in your ST, it is very likely MagiC might not work.

That extra dialog box is to be used with Papillon 3.04 Service Pack 1.
That "Service pack 1" is a Papillon extension available from ASH.
It is in fact an update for Papillon, but instead calling it 3.06
or whatever, they say it's "Papillon 3.04 Service Pack 1".
This new Papillon version makes it possible to set the color pallette
separately for each plane, using the additional dialog box from
RSC. So maybe the English RSC from D&D website works only with
the latest Papillon? As I say, there are two 3.04 versions, which
are significantly different.

Well, I wouldn't say never. This depends on your choice of software. I have both Magic and Geneva, and while I do use Magic a little more than Geneva for basic things (word processing, etc), I do prefer Geneva for certain things. In fact it took me a long time to feel comfortable using Magic more than Geneva (mostly because of some really bad stability problems I had with Magic at the beginning). While Magic is really a good choice, Geneva (without Mint) does a better job with backward compatibility, especially with programs that don't like multitasking OS's, or that are not very cleanly written. I've also found Geneva a *lot* more stable than Magic, depending on the system you run it on. Another advantage is, you can try a demo of Geneva to see if it really is what you need before you buy, while Magic has no demo that I know of (except for Mac and PC versions, which are severely limited by a 15-minute time limit and a speed slowdown routine). And Geneva doesn't take up much memory at all. I also prefer Geneva's fileselector to many others available. The price is a little cheaper, too. I know some people who refuse to use anything but Geneva.

Its disavantages compared to Magic: It's a little slower, it isn't quite as nice looking (although it's much better looking than the ST's GEM), and doesn't support long filenames unless you use Mint, an alternate fileselector, and a long-filename-compatible desktop, like Thing).

I really wish Dan Wilga would have continued development of Geneva. It could have really been a big contender in the AES race, especially in the U.S., where it is much more easily available than NAES. Anyway, I wouldn't say Magic is the end-all and be-all to the OS debate. I would think more heavily on what software you enjoy using, and what kinds of features you really need, then base your decision on that.

My interest in MultiTOS was to see if it was faster (and more compatible)
than my Geneva/Neodesk environment. Atari freak that I am, I was also
curious how my Falcon worked "out of the box" with MulitTOS. Since TOS
4.04 includes many of the features of Neodesk, I thought that I may gain
speed and compatibility using just the GEM desktop and a multitasking OS,
if that is how MultiTOS works. I tried to install EasyMint, but it sure
wasn't easy for me, and I had no success (fatal errors).

In general Geneva/Neodesk is a great solution for me. It may well be that
I would experience the same problems with certain programs in another
environment. I suppose I will eventually get ahold of MagiC (if I can

figure out how and where to order it) to see how that works as well.

Joseph,
I use Magic 6.1 and Jinnee 2.5 on my Falcon. I have

tried GENEVA and it is very nice as well. But MAGIC
does far more than GENEVA will ever do and is far
easier to operate. As far as your memory limit of 4
megs on your Falcon. I have 16 megs (well actually on

14 megs is recognized) and I can have many programs
open at the same time. My browser, email program,
text editor, cd player and Falcamp and Aniplayer all
at the same time. 4 megs if you do not have to much
stuff booting up in your Auto folder or MAGIC
EXTENSION folder will only be able to operate 2
smaller programs at the same time. I would recommend
finding at least a 16 meg upgrade board from
WIZZTRONICS or B & C Computervisions might be able to
help you. If you need any help with URL's or phone
numbers just let me know!!!!!

Thanks,

P.S. You could get a CT60 and install 32, 64, 128 or
256 megs or SDRAM on board, PC100 or PC133!!!!

Are all HP lasers backwards compatible to the old Laserjets? My
injet has almost died (only works in 720DPI) so I decided to get
a decent laser. I need it to work with Imagecopys and Scooters
Laserjet driver. I'm not that keen on using the NVDI drivers,
never got them working very well.

I think I saw a 1240 for sale new at one of the big mail order
places in the UK. I'll have to do some more looking at their
specifications. So even with my driver set to 600 DPI, a 1440
on Atari will only get 300 DPI?

Hmm, I just been checking out the Brother ones, 1440 and 1450.
The 1450 just seems to have extra memory, the 1440 has PCL 4 so
that seems fine. Maybe that has FX emulation too, would be nice!
So, if I had the network card on it as well, is there any way I
can print on the Atari via Ethernet?

Pity that the HP lasers are so expensive. Cheapest I could find
was just under 450 Euros. I've sometimes tried printing via
NVDI from Papyrus but it didn't do anything, not even the
spooler appear. TBH, I haven't played around enough as Papyrus
has it's own drivers. Not many of my applications support NVDI
printers.

Well, I'm talking about Papyrus Gold (version 4) which I guess
is getting a bit dated these days? My other apps though,
Scooter PCB and Imagecopy don't support NVDI, both those apps
have good Laserjet support. I will try printing from NVDI
though, I remember it didn't like my accelerator being on when
printing. This isn't due to the printer port feeding data too
fast either. I managed to make it work if I used iPRN but don't
know how that made things work.

>low last time I spoke to him.

That did look tempting but after seeing some pictures it looks
rather bulky and heavy. HP had weight at 17kg, and something I
didn't understand peak current of 22amps, though only 20 ms or
something. I think I might get a Brother, as they seem pretty
cheap. Brother 1440 for about ï¿½200 (about 300 euros) and it'll
work on all my computers, with parallel and USB if I need it on
my laptop.

Having tried MultiTOS, I can verify that Geneva feels (and probably
is) a bit faster. One of the fascinating things about Geneva is that
Dan was able to keep it from dragging down the computer -- it's
scarcely slower than singletasking!

I don't use MiNT much, but I do have a basic system installed on a
Syquest disk. MiNT is much better at performing multiple operations
SIMULTANEOUSLY (like copying files while surfing the net), and a few
programs require MiNT, but for most things I've been quite happy
sticking with Geneva, and it remains my default configuration.

MultiTOS, when installed, looked exactly like the TOS desktop save
that you could open multiple programs which appeared much the same way
as accessories in the "Atari menu." It slowed the system a bit, which
Geneva does not, and was less compatible than Geneva. MiNT has
improved significantly on MultiTOS, but installation is still a bit
more than 'click here'. It would be helpful if an 'idiots' guide were
developed for those who may not know how to unpack a .ZIP file or
create a RAW partition.

Somebody posted the other day stating the Battle Chess would not run
on the Falcon, but just bombed out. After copying it the HD on my
Falcon I had a quick game and had no problems, I did not even have to
drop down to ST Low resolution before I launch it I run straight from
mu usual 80 col, Double Lines Off, 256 colour resolution.
Perhaps it needs a "clean" system to run on as I am using just plain
TOS 4.02, no third party OS's or Desktops.

As far as I can tell they are backwards compatible. This is definitely the case for the 2200, which is quite new. HP LaserJet III drivers for TempusWord work fine, for example. With the NVDI drivers I could not observe any problems so far. I'm currently using one of the LaserJet 5 drivers with NVDI and the output is correct. You cannot use 1200 DPI, however, since the drivers only support 300 or 600 DPI.
The 2200 supports the latest versions of the PCL and PJL languages and detailed documentation on these languages is readily available in the Internet, BTW.

Ah, I see. Forget the Mint distributions if all you want is a very basic Mint+AES. Those are for installing full UNIX, MintNet, etc. setup, which isn't necessary for a Multitasking GEM setup. Try this:

1. Set up a new AUTO folder (rename your current one to AUTOX or something along those lines), and temporarily disable your ACC's (rename them to ACX, for example).

2. Create MINT and AES4_1 folders in the root directory of your C: drive.

3. Download the latest Mint (kernal only, *not* any distribution kit like EasyMint, KGMD, etc.).

4. See if you can track down and download AES 4.1 (there should be one at that Belgium FTP site that often "advertises" the new available files in the newsgroup - Champelie or something like that). If you can't, I can e-mail you a copy, or try www.freemint.de (I think that's the site).

5. Place the MINT030.PRG in your new AUTO folder, and rename it to MINTNP.PRG.

6. Place GEM.SYS (from AES 4.1) in the AES4_1 folder.

7. Place the MINT.CNF file in your MINT folder.

8. Edit the MINT.CNF file with QED or other Text Editor to *only* have these lines:

```
SLICES=2
HIDE_B=YES
setenv AESDIR C:\AES4_1\
GEM=C:\AES4_1\GEM.SYS
```

9. Reboot and see what happens.

If you'd like long filenames (although you'd need a new desktop and fileselector, like Thing and Boxkite), add the following lines to MINT.CNF after "SLICES=2" (letters indicate the drives you want long filenames on):

NEWFATFS=A,B,D,E,F
VFAT=A,B,D,E,F
CACHE=512

The "CACHE=512" setting sets the filesystem cache in Kb. You can decrease it (or remove it, I suppose) for more available memory, or increase it for more filesystem speed. There's also a writeback cache option, but I usually leave that out, as you then *must* run a shoutdown routine before shutting off the computer. It also takes more memory. Anyway, try that and see if it works for you. You can then add your other AUTO programs, ACC's and CPX's. Watch out, though. Some AUTO programs *must* run before Mint, while others *must* run after Mint. Add things one at a time, reboot and see how it works. If it crashes, switch the order in relationship to Mint and see if it helps.

Another thing you can do: replace the AESDIR and GEM path settings to point to Geneva (preferably the copy of GENEVA.PRG in the GENEVA folder itself, otherwise GENEVA.PRX in the AUTO folder works as well). It becomes somewhat unstable compared to Geneva without Mint, but tweeking your AUTO folder order and what ACC's and CPX's you are running can improve that. I've actually got a fairly stable and quite usable Geneva+Mint setup running on my Falcon.

Good luck! Hope this works for you!

| if you ask me because of AUGUR, I'm sorry I can't answer for I never
| saw it perform.
|
| I'm satisfied with both OCR and SYNTEX, but now I prefer OCR.

Yes, I prefer OCR as well. One of the advantages is that you can control what it recognises by editing the font. Syntex would sometimes mistake an e for a c say, and propagate the error through the whole document. I had difficulty getting to grips with Migraph as well.

I think it was Signa Publishing systems who promoted Syntex and Augur in the UK.

>Dan was able to keep it from dragging down the computer -- it's
>scarcely slower than singletasking!

Usually Geneva is faster compared to standard single TOS. But, MagiC is even faster than Geneva! Its actually upside down compared to other popular (MS) operating systems... Has to do with optimized code and we may thank Atari Corp. for not developing faster and faster computers up to today. If they would we would have to struggle with an "Atari XP-TOS" that needed 128 MB RAM to start and big harddisks... :-)

>programs require MiNT, but for most things I've been quite happy
>sticking with Geneva, and it remains my default configuration.

Only tested for short periods with Geneva+MinT but the gain was not worth it at all imho. Geneva really outperforms MagiC when running some older programs that needs to run in "single mode". In Geneva you still can switch between "single mode" programs and have access to ACC's etc. Even Cubase (sort of) works under Geneva.

Drawbacks in Geneva are it does not work as good as MagiC or TOS with STinG and serial ports. Even on a TT I loose packets in 115200 and 153600 bps is out of the question.

Also Okami does not work with Geneva. The latest versions does not work with single TOS either afaik. Anyone who can get it to work properly in TOS 3.6??

Hi Atari Group,
I recently acquired a few Atari games in an all or nothing trade and since I'm an IBM PC game trader only, I figured someone in this group might want them. This is a single package deal and they are free for the cost of shipping. I figure USA shipping to be about $5.50 for Priority Mail w/Delivery Confirmation or about $3.50 for Media Mail w/Delivery Confirmation. I will of course get a firm shipping price for anyone who is interested and I will ship outside the USA.

Here's the games (All in like new condition) -

Knight Orc - New/Sealed in Box
Golden Path - Box, Game Manual, Disk, Registration Card
Tracker - Box, Playguide, Disk, Short Story, Instructions, Poster, Registration Card
Guild of Thieves - Box, Game Manual, Disk, Contract, "Bank of Kerovnia" Card, Adventure Guide, Registration Card
Starglider - Box, Playguide, Novella, Disk, Keyguide, Poster, Registration Card

I am a member of The Game Trading Zone. Here's a link to my GTZ webpage so you can check my references.

http://gametz.com/user/Sirocco.html

Cheers,
Rick

I also started my first multitasking with such a simple setup, using
mint 1.15.10b and N.AES 4.1, and a minimal mint.cnf file. Very similar to
the original Multitos installation that came with my Falocn.

Such a setup is: easy to install, easy to use, and VERY easy to crash.
I never managed working with it for more than 10 minutes (usually seconds)
before the system crashed or hang.

I had to make further steps for a major improvement:
1: Read some docs about MiNT (about Memory Protection in particular)
2: Replaced AES 4.1 with XaAES (or N.AES)
3. Added THiNG 1.27 and got a registration for it.

My system was much more stable now, and I could now use it seriously.

Later, when I had more power and memory in my CT2b-Falcon, I stepped into
a very complete and sophisticated Easymint setup. This again gave me some
reading to do. A little book about Linux/Unix for beginners helped me a
lot to explore the added power of all those Unixoide command line apps
that look so unfriendly to an old Atarian at first, but give me much
pleasure now.

Thank you Martin. :-)

Yes, XaAES is designed such that it can simply replace Atari GEM.SYS
Loading all of XaAES in a directory and let the GEM line in mint.cnf
point to XAAES.TOS in that directory should do the trick.

Read the docs first (usrguide).

If nevertheless you have problems, just email me.

Already the first tip:
Thing comes standard with lots of colour icons. these can take up about
a Mb of memory. Remove unused icons, or rename Thing's mono icon file.

> Lyndon Amsdon wrote:
>
> > Are all HP lasers backwards compatible to the old Laserjets?

Almost. Here's a brief rundown of the PCL commands used to control HP printers. More is available at http://www.hp.com/cposupport/printers/support_doc/bpl04568.html .

PCL 1
Supported by practically all HP LaserJet Printers. Provides text printing for single users. Introduced in the early 1980s.

PCL 2
A minor improvement of PCL 1, adding multiuser support.

PCL 3
Released with the HP LaserJet series. Allows for the use of a limited number of bitmapped fonts and graphics. Often called "LaserJet Plus Emulation". Most HP Deskjets in the 500 and 600 series (like my 610CL) use PCL 3 with some modifications. Introduced in 1984.

PCL 4
Released with the HP LaserJet Series II series. A superset of PCL 3 that provides new page printing capabilities, macros, larger bitmapped fonts and graphics. Introduced in 1985.

PCL 5
Released with the HP LaserJet III series. A superset of PCL 4 that provides font scaling, outline fonts and vector graphics. Introduced in 1990.

PCL 5E (Enhanced)
Released with the HP LaserJet 4, 5, and 6 series. A superset of PCL 5 that provides for (and requires?) bidirectional communication between the printer and the PC.

PCL 5C (Color)
Released with the HP Color LaserJet series. A superset of PCL 5E that provides the commands needed to support color printing.

PCL 6
Released with the HP LaserJet xx00 series. Features a new modular architecture that is NOT a superset of previous versions!!! Fortunately, current printers appear to have both 5E and 6.

The bottom line -- pretty much any HP printer (inkjet or laser) made in the last 10 years can be driven at 300 dpi black with a Deskjet 500

driver (PCL 3). Any 600 series Deskjet can be run at 300 dpi color with a Deskjet 6xxC driver. Any laser printer made in the last 10 years can be run at 600 dpi black with the Laserjet III (PCL5) driver. However, as PCL 6 becomes more common, HP may start to omit PCL 5 from its future printers. If this occurs, Atarians will be unable to use our existing drivers.

Personal note: I have a HP 610CL Deskjet that uses NVDI 4's HP 660 driver to get 300 dpi color. I've also been successful using the Laserjet III driver to get 600 dpi black out of the Deskjet. For reasons that are way beyond the scope of this post, there isn't much practical difference between 300 dpi black and 600 dpi black though.

If you are really interested in laser printers, may I suggest looking at the Brother 1450? (See http://www.brother.com/usa/printer/prn_personal_list_cntr.html). Not only can it use the Laserjet III driver, but it can also emulate an Epson FX, so it will print off darn near any Atari program ever written!

Source record: 34357

Anyone,
I bought a 40 GB 7200 RPM IDE MAXTOR model number D740X-6L. Ever since I installed this hard drive, I have always had to start my system up twice before being able to do a complete boot up the second time. I have the MAXTOR 40 GB hooked in second on my IDE chain, (the smaller 84 meg IDE is first for bootup files) and the power is supplied by my PC tower to the IDE MAXTOR hard drive. There is only 2 ways that I know of to get my MAXTOR to work.

1st way to bootup
BOOTUP to the XBOOT screen then shutdown and reboot and everything will be ok!!!! (This allows the MAXTOR hard drive to spin up on the first bootup so that all partitions will be recognized on the second bootup).

2nd way to bootup
Once I have the power turned on to my PC tower unplug the 40 pin IDE ribbon cable to the MAXTOR hard drive and the MAXTOR hard drive will begin to spin up and it can be booted with NO problems.

My problem with the 1st way is it is time consuming 20 to 30 seconds everytime I want to bootup. Not to mention wear and tear on my Falcon. The second way could really wear out my ribbon cable not mention my IDE MAXTOR hard drive.

Is there any solution that could resolve this problem???????

Thanks,
Carey Christenson

Papyrus has its own drivers? I would have expected software like
Papyrus, which is quite new, to be able to use NVDI for printing.
Anyway, as long as drivers for older LaserJet models (III or 4L etc.)
are provided, this should not be an issue.

Unless you have the means for writing your own driver. This is possible
with some old pieces of software like Tempus Word, where you can define
your own printer drivers.

An '020 does not have an MMU - yoiu will need to add a 68851 MMU.

An '030 has a subset of that MMU built in.

Message-ID: <3cfe177b.68078021@nntp.clvhoh.adelphia.net>
Source record: 34363

Hey everyone. Lately I've been leaving my TT powerd on a lot more. Right now I'm trying to set it up as my web server through my cable modem, but I've been having some troubles.

After being on for a while (as in an hour or so), MiNT really starts to break down. Just about everything starts causing bus errors. This couldn't possibly be a memory problem since it has 64 meg of TT RAM. Memory protection is not enabled, but I don't think that should improve things. Also, my Minix partition really turned to crap, so I've recreated my entire MiNT directory structure on a FAT32 drive (any problem with this?) but that hasn't helped.

The only thing I did notice is that the TT seems to be blowing a lot of hot air out of the power supply. Is this possibly an overheating problem?

The system is in a stock TT case with a Magnum 64meg memory expansion, a GALAXY graphics card, and a ROM-port ehternet adapter. Any thoughts on what the problem is?

This is really starting to get me angry. If this isn't fixed, the TT is going into retirement.

Jeff Armstrong

Maybe the PSU is having problems - some dry capacitor causing +5v not
to be clean, or, more possibly, too many devices for this poor PSU.
Try with an old 250 W PC AT supply, and see if problem persists.

I think that some time ago someone suggested here that strong kitchen-cleaning agents (perhaps slightly abrasive?- or maybe better not abrasive?) are good at removing that colouration.

I do not know. The program has a "book" of recorded famous games, but
otherwise I do not know how good it is. In any case it is better in chess
than me- I just know the basic rules; perhaps someone who is a good
chess player might care to comment on the relative merits of different
programs. (I remember that once a computer magazine here organized a
tournament for chess programs on home computers).

I have just tried Okami version 3.0A-9 with TOS 3.06, and it worked
correctly. However, it crashed when I tried to open "About
Okami" info dialog. Reading and writing messages worked OK, though.

Well, maybe I'm doing something wrong :-(On my (bare) Falcon the opening screen loads fine, but when I press Return all I get is a small dialog showing some titles of games, I presume. Repeated presses bring up further titles, but I can't get any further.

I don't have the instructions to hand (yes, I do have a legitimate purchased copy!) so don't know if there is something else I should do. But none of the other keys seem to do anything.

One of my TT's have been powered on now since December 2000 without
problems. The fan blows 35.4 ï¿½C right now with room temp at 26.2 ï¿½C. I
have turned it off for some short intervals a couple of times and it is
becoming rather dusty inside so I will have to service it and
clean/inspect the power supply shortly...

>The system is in a stock TT case with a Magnum 64meg memory expansion,

Could be power supply.

My webserver TT does not work with a standard 8 MB Atari TT RAM card.
This card is now inside another TT and works well there. Fortunately my
Magic/STinG setup with the Weblight server runs fine on 4 MB ST RAM. A
MinT setup with Apache(?) will use up much more memory, I guess.

Newdarkling,
Seems the only person doing any real name calling
here is YOU. Remember that the ST is NOT the only
computer that Atari did!!!!! And also remember that
the Falcon with a CT60 would give very good
competition to any AMIGA!!!!!! My falcon has 16 bit
stereo and as soon as I get my DEESSE card I will be
able to go all the way to 96KHZ.!!!!! So dont sit
there and tell me that AMIGA is the best when it comes
to sound and graphics when Atari's and MAC's do just
as well!!!!!!!!

The 1440 is ONLY PCL 4, which will work fine with a Laserjet III
driver (you could use a Laserjet II or Deskjet driver as well, but
only at 300 dpi black). It does NOT have FX emulation.

the 1450, although it is listed as PCL 6, probably has PCL 5e as well,
so it should make a good Atari printer (please note I haven't tested
it). One thing that really impressed me about a friend's 1240 (a
couple of years old) is that the printer auto-sensed printer type with
no setup required. Word Perfect's Proprinter driver, NVDI 2, and
<alt-help> screen printing all worked perfectly with no need (and in
fact no way) to tell the printer what would be coming at it next.

Sounds very much like overheating. I ran a BBS on a 1040ST and then my TT, I had to mount a fan next to the machine to blow air over them 24 hours a day, otherwise they both would act up. (It blew over the hard drive too which would shut down if overheated)

This could actually cause system failures? I'm surprised, that's all.
Ok, then does the TT just accept a standard AT power supply? I can't
seem to remember. This sounds like it's going to be quite a project
just to stop these system crashes.

Has anyone had similar symptoms?

Yes...

>Ok, then does the TT just accept a standard AT power supply? I can't
>seem to remember. This sounds like it's going to be quite a project
>just to stop these system crashes.
The connectors of an old AT PSU will fit the TT's socket with little
modification. For the wires, let me see...
Well, they are the same on both connectors, except the AT's got a red
wire between yellow and orange, where TT's got empty. You'll just
have to unsocket this wire from the AT's connector, and plug both
the connectors on the TT's socket, *after*checking* that the voltage
of each colour is the same, of course!
On the one I have there, it is good, but... who knows ?

130. MintNet on a 4Meg ST with TOS 1.6

Newsgroup: comp.sys.atari.st
Date: 2002-06-06 12:18:03 UTC
From: Dave Wade <dave@_spam_is_Bad_dwade.freeserve.co.uk>
Message-ID: <adnjo7$6db$1@newsg2.svr.pol.co.uk>
Source record: 34386

Folks,
I currently have my 4Meg STE networked via a Cartridge Port NE2000 adaptor, using STING and the old freeware version of CAB, GAPFTP and Newsie. The main purpose of this was to allow the exchange of files between the ST and my PC and as such it seems to work fairly well, but with slight niggles.

The best results to date have been using one of the CLI based FTP programs on the ST talking to Windows/2000 FTP server. The big niggle here is that whilst these will allow me to do an "LCD" and change directories I can't make new directories on the ST or download a nested tree of files.

I have tried using the graphical clients on the ST and none of these seem to work well with my aged system. The FTP client in Newsie does not seem to like the W2k ftp server and just returns a black screen when I open a directory. Aftp does not like my old AES and so won't work at all. MG FTP seems to die before it gets a connection open.

The only graphical system that seems to work is to use FTP Server from Vassilis on the STE and run a Graphical FTP on the PC which was not the way round I wanted. So I was wondering if it would be possible to run MintNet and the SAMBA client on such a small machine. And if it was possible where would I look for the parts.

Thanks in advance for any suggestions,

Dave.

It should be possible with older FreeMiNT kernels (that does not requre so
much memory), but if you do not have a harddisk it will be a very hard task.

Everytching you need is on http://sparemint.atari.org.

Well, I seen people mentioning that Falcons go for around 100 UKP.
Unfortunately, I've never seen one anywhere near that price myself,
or I would have bought two or three of them...

When I bought an extra one (80 Mbyte disk, 14 Mbyte RAM) a couple of
months ago, I payed nearly 250 UKP. That was certainly more than I
would have wanted to pay, but I could not find anyone else who wanted
to sell one. Except for on eBay that is, but at the time the Falcons
I saw there went for close to double that amount.

If the monitor is one of the small Atari mono or colour ones, I'd
not pay more than at most 15-20 UKP for it.

>"OLD", Why try to solve a problem with possible unreliable cures.

Just because there's almost nothing to do to plug their socket on the
TTs ot MSTe's one, except unplug one single wire!
And because new ones are ATXs, which need either an adaptor to fit
the TT's socket, or to modify their connector.
And, old only means that it is not a recent ATX one, not that it
will die as soon as it will be turned on!
And it was only to allow (sorry, I forgot his name) to test if it
was really the PSU without having to waste money.

Mike,

Just for interest I did a couple of tests with my NE2000 Cartridge Port
adaptor, and seem to be getting between 50 and 60 K/Bytes second
between my STE with internal IDE Drive and my Windows/2000 PC
which is a fairly old AMDK6-350 running a similar card...

Dave.

It's kind of slow, but here is a test post from the Falcon with the SCSI Link operating. Kind of cool having the Falcon on Ethernet. Pls excuse any Falcon time stamp (if any) my clock is way off:) I need to remember how to use this thing. I sure miss MiNT, but the SCSILINK driver didn't work under MiNT. My MagX is pretty old, don't really want to try iton the Afterburner. Will try some other STinG settings to get up to speed. Hey, Newsie still works!
Mike

152. FS: C-Lab Falcon Mk-II + CAF (Europe/Czech Republic)

Newsgroup: comp.sys.atari.st

Hi,

my friend has a falcon for sale:

+ C-lab Falcon MkII (4MB RAM, box, english manual, etc...)
+ internal 2.5" SCSI (!) HDD 420MB (Toshiba)
+ ergonomic mouse (called manhattan, AFAIK)

+ Cubase Audio Falcon v2.3 upgraded to 2.6 (box, dongle key, 44.1kHz clock,
english manual)

Complete for 499 Euro

I can bring it at the "Platariada" party 22.-23. June in Budweis, but only
in case when someone will be interested. In other case, mail to me or
directly
to pavelhokr@atlas.cz.

Regards,

Ctirad

Well, this is only one point of view.

IMHO people that are likely to move to a faster computer will continue doing this as long as they have enough money. I'm a professional programmer and I consider any computer to be slow. ;)

It would be good to have a great HW, but there is no market and therefore it would cost a fortune, if there is any new produced in the future at all, and the producer of such a hardware would quit it in a year or so (my guess).

In fact I didn't move to an emulator. We, the ARAnyM authors, don't talk about it as an emulator because it is not an emulator. It is just a virtual machine that ensures any processor to have the m68k instruction set. Even Milan guys were considering to create such a software leayer over the Linux OS. We came as the first ones and I personally don't believe in any further HW to be created on m68k processor. If you want to speak about coldfire project or any other falcon speeder like the rumorous Tempest then you have to know that this is in fact the same as ARAnyM, but only with a different host CPU type. ARAnyM is able to compile and run on a wide variety of CPUs like x86, Sparc, MIPS and many others you can port it to.

I'm also very sad that people don't actually see the future of the TOS or better FreeMiNT platform. As far as I can see 90% of you all are just sitting and watching your MagiCPC or Gemulator screen paying for that a fortune and beeing limited to a specific host OS. As far as I can say there are a very few people developing FreeMiNT or TOS software. I know MagiC has something that FreeMiNT doesn't, but it is death just because it is commercial and the comunity (the ASH market) is shrinking. FreeMiNT and the open-source projects are live. There are developers who dedicate nearly all thier spare-time for it. But you users... you are just continuing to use MagiC not seeing the future.

I would say that if everybody moves to ARAnyM, EmuTOS, fVDI, FreeMiNT and XaAES then we all would profit from that with having a great bunch of new modern applications. All the missing features will be implemented and everything you will get for free!

One example of all: If you miss MIDI for ARAnyM then it would definitely be possible to do something about it. We can develop some HW plugable to some ports or just a binding to an existing MIDI card or whatever. But

do not consider that you will get ARAnyM to be a complete TOS clone
without saying that you use it and what you really want.

Please think about it at least for 10minutes before you reply. And
consider the fact that I am not the only person helping on ARAnyM and my
opinions may differ from the others.

best regards

the
> importance of hardware

Well, I run Aranym on 1GHz Athlon with plenty of RAM, Matrox G400 dualhead graphics, soundcard with 5.1 output, ATA100 harddisk, 100Mb ethernet and TV card. That's pretty real hardware, isn't that ?

> and move on to emulators...

So stay forever with your ST/TT/Falcon, beacause all newer machines are emulators by you.
Any PPC/Coldfire TOS clone = a slow, expensive, buggy and hardly available hardware + Aranym-like OS on the top.
My choice is a fast, cheap and widely available hardware (PC) + Aranym.

My current TOS machine has a 68040 (with FPU) compatible CPU, 128MB of RAM, 1024x768 in trueclor (of course hardware accelerated) and very fast harddisk access. And what about yours ?

Ctirad

James, you snivelling wet rat, we are most amused at your constant jumping around and having fights with these "sockpuppets" you keep thinking everyone is...Everyone is a potential sockpuppet to you, and yet you anally try to keep up a verbal front with each and every one of them....This is so entertaining that I am even thinking of inventing 5 more darklings with new names on this site....Then we will see you dance even faster....

But I say again, you are exhibiting the normal, text-book behaviour of an ST owner...stop your intimate relationships with your ST and pull your tongue out of the joyports underneath your ST....contrary to what your hazy and confused mind tells you, your ST will NOT achieve orgasm by licking any of its ports....Snap out of it....

While I do love the Aranym project, I have to say that you're being quite abrasive to some users. First of all, I see no harm in developing hardware solutions. A lot of people prefer the quirky hardware like the upcoming Coldfire computer. Sure, it's a small production run and the hardware might be expensive relative to PC's, but it's not prohibitively expensive and it provides a very modern hardware platform for Atari users. Aranym takes a different approach by employing PC hardware and an 040 emulation layer. Both are valid techniques.

Second, you're very critical of commercial software. I think you could alienate a lot of Magic users with this kind of talk. Personally, I've used XaAES on top of MiNT and I have to say that the commercial alternatives, N.AES (on top of MiNT) and Magic, are more mature poducts. I'm sure XaAES will be great, but it's just not completely finished. A lot of people consider commercial software availability as a sign of the health of a market. I think that if there were no commercial products available for the Atari, I might leave the market. Open source is definitely a good thing, but many people don't feel it's the answer to everything.

These are just some thoughts, but I just want to be clear that I'm excited about the Aranym project and I can't wait for ethernet support, at which point I will definitely set up a system. I wish I could help, but I'm more of an end user. Keep up the great work!

While I have to agree with most of what you say, I still think of ARAnyM as an emulator. Virtual machine and software layer are just fancy names for an emulator. No matter how cock-eyed you look at it, it's still an emulator in my eyes.

Joshua.

TOS Clones are not emulators. Firstly they are purposely built Atari
compatible computers and secondly, they run TOS software natively with no
need for any software layers in the middle. I can't speak for Tempest or
AtlanTOS because they are not out yet.

Hey, if you have no problem with that, cool. I, however, can't, and will not
go for an emulator.

Joshua.

it is an emulator, why else would you emulate the videl and stuff like
that?
The difference between aranym and tempest is that even
though the latter has to emulate it still sits in a falcon, using
falconhardware. I know you can use aranym on falcon or but whats the
point?

>

thats bollocks! what makes you think we would see alot more applications
just because we used aranym?

>

I think the reason we all still use our ataris is because they are slow,
because the hardware has got flaws, because they have what aranym and all
emulators lack, its spelled SPIRIT.

Fredrik.

I offered a guy a falcon for 50ukp + p&p, he didnt have the money though
so I still have it though I took it apart and used the spare parts now so
its not for sale anymore.

Also I've bought 5 falcons for less than 200 ukp each, you just have to
look at the right places..

Fredrik.

From: Christopher Coxon <Gusbucket@btopenworld.com>
Message-ID: <adqphgepl1@helle.btinternet.com>
Source record: 34320

I am collecting a private Museum of all the Atari XE Onward computers and their hardware accesories, I have been told by someone that supposedly owned one that there was an Atari ST 4160 they said theyd sold it to a German collector.

If anyone can shed any light on this I would be very interested in this and any other T Items, working or non working Im not fussy,

Has anyone on this newsgroup ever compiled a list of all variants? (Im talking official Atari not homebrews) I just got on E Bay an ST Mega4 I already Have Mega1 and Mega 2 and Mega STE, but I need a Falcon and a TT to complete the main models lineup.

All help appreciated as I'm a bit of a beginner at this.

I have a STFM socketed test motherboard and loads of 256k and 4Mb ram upgrade chipsets which I brought from a dealer closing down, If anyone wants any of these please feel free to get in touch direct. I hope to be able to offer eventually a diagnostic and repair service. If anyone also has any test equipment they dont need any more - specifically for Ataris I would be very keen to obtain it

Cheers
Chriss

Yes and no. For example Milan is a PC style hardware which has nothing to do with any real Atari machine. It has no Shifter/Videl, no Yamaha, no ACIA/IKBD, no atari audio, etc.. All TOS compatibility is only in its TOS OS. With different ROM it could be an Amiga clone, 68k MAC, Linux box or even NeXt as well. With non 68k TOS machines (Coldfire/PPC) it is more complicated, because you need 68k compatibility = CPU emulation. It's exactly the same as Aranym does. It's also exactly the same as Apple did with powermacs, BTW.

Ctirad

A pity you did ask me (or mentioned it in some place I'd see it).
I'd have paid 50 UKP in an instant.

>Also I've bought 5 falcons for less than 200 ukp each, you just have to
>look at the right places..

Could you, please, enlighten us (or is it just me?) as to where those
places are? I checked out all the places where I've previously bought
Ataris, VICs, Amigas, Sinclair machines, SGIs, Macs, SPARC and Alpha
stations etc at very decent prices and found next to no Falcons at all.
Definitely no cheap ones.

Actually, I've been on the lookout for an extra Falcon for a few years
and not seen a cheap one, although it was only for a couple of months
recently that I really searched for one (the CT60 was getting near
and I did not want to remove my AB040 and Eclipse).

I seriously would have bought two Falcons at 100 UKP each without
thinking two seconds about it. To me that suggests that it would be
a very cheap price, but I guess I might just be silly. ;-)

> by employing PC hardware and an 040 emulation layer.

I don't think it's so different. The main difference is that Aranym is based on hardware which already exists. The rest (TOS compatible OS with built-in 68k emulation) is pretty same for both.

> Personally, I've used XaAES on top of MiNT and I have to say that the

> mature poducts.

The XaAES is still a little bit less usable than N.AES (for me the MagiC is nothing more than a multitasking TOS with nice looking desktop), but it has one big advantage -> it's not dead.

> I'm sure XaAES will be great, but it's just not

> people don't feel it's the answer to everything.

Sure. However, the minor OS should be opensource, because in other case it will not survive (look at BeOS for example). Commercial apps are OK and welcome.

Ok, that kinda makes sense but I'm still very sceptic. The day I will go for ARAnyM is the day somebody hands me a BIOS chip for my motherboard that will allow me to boot straight into TOS with no need for Linux/Windows/DOS. If you can do that, I think I will join you.

Joshua.

From what I've seen and heard over the years Atari had planned a 4160STe which was pretty much a stock 1040STe with 4 1 meg simms (instead of the 256k simms) and the badge (you know that metallic label thing) which read "Atari 4160STe". From what I've been able to gather, many of the dealers at that time didnt like the idea of stocking 2 different versions of essentially the same machine for just a different memory configuration when they could get simms from their suppliers and easily do the upgrade themselves if customoers wanted it. Atari did produce the 4160STe badges and made them available to dealers. I'm not sure if many dealers actually used them though. These days you can get the badges from Best electronics and perhaps some other mail order places.

I think there must have been some kind of miscommunication here.
Standa did not say the _Falcon_ was slow. He said he considers _any_
computer slow.

I quite agree, as long as we are talking about computers a normal
person could actually use. There are some massively parallel machines
that already have more computing power than I would have any idea
what to do with, but they would not be terribly useful for the kind
of stuff I like to do, anyway (I don't plan on simulating nuclear
explosions any time soon ;-).

>> In fact I didn't move to an emulator. We, the ARAnyM authors, don't talk

>it is an emulator, why else would you emulate the videl and stuff like
>that?

To be able to boot an existing OS?
ARAnyM generally only emulates as much as it absolutely needs to be
useful.

I doubt anyone actually uses ARAnyM with the Videl emulation active.
It would not surprise me if a future version of ARAnyM didn't have
the Videl code at all, or at least made it a compile time option.

>The difference between aranym and tempest is that even
>though the latter has to emulate it still sits in a falcon, using

Not necessarily. Take a look at recent Tempest news in various places.

>> and XaAES then we all would profit from that with having a great bunch
>> of new modern applications. All the missing features will be implemented
>> and everything you will get for free!
>
>thats bollocks! what makes you think we would see alot more applications
>just because we used aranym?

I think he is thinking along these lines:
Once the JIT starts working properly, ARAnyM will be way faster than
any Atari compatible machine (it should be close to or faster than an
'060 machine even now on fast x86 hardware).
That would finally make it possible to make real use of the masses of
open source software out there. Mozilla, StarOffice (well, the open
source version, whatever it is called) and The GIMP to name three.

>I think the reason we all still use our ataris is because they are slow,
>because the hardware has got flaws, because they have what aranym and all

Uhm...
Well, to each his own.

>emulators lack, its spelled SPIRIT.

Can't say I ever noticed any of that. Of course, I've almost always
used several types of computers in parallel (only recently PCs, though).

For that matter, I have personally never understood how people see
a difference between a 'real Atari' and a mostly perfect emulator,
as many of them are.

Note that ARAnyM is not in any way a 'perfect emulator' and is not
intended to be. It could still be considered more in the Atari spirit
than anything else out there.

Power without the price!

Remember?

173. I'm back (with a question)

Newsgroup: comp.sys.atari.st
Date: 2002-06-07 18:40:49 UTC
From: k@uia.net
Message-ID: <ug1vhh3ojnm368@corp.supernews.com>
Source record: 34329

After being off of the newsgroup due to the closure of Deja.com, I've finally decided to try Newsie (hope it works...I think I did something wrong a few minutes ago, so I'm trying again.)

I've spent part of today looking for a way to send money to European merchants who don't take credit cards of U.S. dollars. So far, the cheapest option for a money order has had a charge of $40. This is a bit extreme considering the money order itself will be for only $150.

Thus, my question is, "What dealers in Europe take U.S. dollars or Visa?" Unless I find one, my next option will have to be some well-wrapped bills obtained at the currency counter of the airport. This is not a real good option.

Galen

174. SLM 804 rebirth

Newsgroup: comp.sys.atari.st
Date: 2002-06-07 18:43:50 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <adqut6arg1@reader1.panix.com>
Source record: 34330

This is a preliminary report. It is not fixed yet.

My SLM 804 started dropping a little toner into the paper path, making dirty edges on the copies. It ran out of toner, and so, being in a hurry, found some loose toner, and dumped it in. What a wonderful mess it made. It just poured through, and paper covered with fixed toner wrapped itself around the fuser drum, One can bleed quite a lot trying to work in that area. Never mix toners. It will make a mess somehow.

The problem was a bearing. It makes noise like gritty toner, but it is a bearing. They are available, in US stock, and cost about $32 USD each, for two of them. That is about half of the price of a new developer assembly.

A fine flat file can make the edge of the doctor blade look shiny again, and replacing the bearings for the magnet roller is the only cost.

So if yours starts dropping a little toner onto the paper path, the problem is a bearing, and it will only get worse. If you have basic tools and a little mechanical skill, it can be fixed cheaply, but not necessarily neatly, because that toner gets in everything.

And, the blade to magnet roller clearance will need to be set by eye, unless you can measure gaps less than 0.001 inches. That does not seem to be difficult.

I did not write down the bearing number, but from memory, it is a Continental SKS-678-ZZ. I will get two new ones Tuesday.

I heard that 4160 also had a 286 intel cpu builtin and some aditional
hardware working as PC (hardware) emulator.

I had plenty of ppl interested in buying it but I offered it to him for 50
quid cus its a bit dodgy but fully working. 50 quid cus he was (and still
is) a friend on mine.

ok, I bought 1 ab040 with nemesis, novacard and all sorts of stuff for
150ukp after some guy posted on atari.org forum. 1 std falcon (brand
new) from indigo in denmark for 2000sek, 1 from a good friend of mine for
1000sek, another one from a guy who I knew since a couple of years for
100ukp, 1 falcon in a tower from ebay.de for 150ukp.. thats five..

and IRC is the place to get to get to know atariusers btw.

if you read the rest of the post that is what its all about. "If everybody
moves to aranym then we would profit from having a great bunch of new
modern applications" since running aranym on an atariplatform is out of
the question (you can obviously but there is only so much point..), all
there is left is pcs, macs etc. Apparently we cant see the future of the
tos and freemint platform, since he is quite a bit biased towards aranym I
can only assume he means abandoning atarihardware to use aranym, which I
think its sad.

There is no reason to use atari if all you are looking for is speed.
And why would we bother trying to port mozilla, staroffice and everything
else and to get it to run on aranym in a win/linuxenvironment at all? its
avaible for those platforms anyway! I know you can use aranym on any
machine (hence the name..) but I cant see why you would want to run
mozilla in aranym on a pc which has got a native version of mozilla

anyway.

you just dont get it do you.. why do ppl perfer the real thing before a
mostly perfect emulator? I think you answered your own question.. there is
no such thing as a perfect emulator and I dont think there will ever be
one.

Eric,

Atari Workshop (www.atari-workshop.co.uk) accept VISA but
I don't know what shipping to the US would be. ASH also have an
on-line shop so I guess they must take some type of credit card.

They also have English version of many programs.

Dave.

Hi Galen,

My American friends and I uses Western Union (the company with brown trucks)
money transfer.

I thought it was pretty obvious that he simply upgrades his computers
whenever he can, since they are always slow. I do the same, only I
never sell any of them.

No, but some other things need to be emulated for that. The Videl was
necessary for it to be useful before there was an fVDI driver.

>> Not necessarily. Take a look at recent Tempest news in various places.
>>
>? if you mean it doesnt have to sit in a falcon then fair enough but still

Note that the newsflash mentions adapters for Hades/Milan. Then consider
what those adapters must be.

>tos and freemint platform, since he is quite a bit biased towards aranym I
>can only assume he means abandoning atarihardware to use aranym, which I
>think its sad.

Well, some of us have no emotional ties to the hardware itself.
As has been mentioned, the Milan has next to no hardware in common with
a 'real' Atari, anyway.

To get something modern and reasonably fast, at a reasonable price, the
hardware will by necessity have very little in common with the original.

>There is no reason to use atari if all you are looking for is speed.

That's of course quite right.

>And why would we bother trying to port mozilla, staroffice and everything
>else and to get it to run on aranym in a win/linuxenvironment at all? its
>avaible for those platforms anyway! I know you can use aranym on any
>machine (hence the name..) but I cant see why you would want to run
>mozilla in aranym on a pc which has got a native version of mozilla
>anyway.

No reason at all unless you do indeed want to keep the Atari environment,
which I thought was what we were talking about. Currently, anyone who
wants to do more than the Atari computers have the CPU power or software
for will have to keep another machine on the side (IIRC, all Atari users
I know have at least a PC too, for example).

Eventually, there is likely to be an ARAnyM distribution similar to the
Amithlon (an Amiga 'emulator'), if you've heard about that.
Just put a bootable CD in your PC, Mac, or whatever and start it.
Up comes something that will to all intents and purposes be a very fast
Atari compatible machine. There will of course be a Linux kernel (or
something like it) underneath, but you'll never see it.

>> >I think the reason we all still use our ataris is because they are slow,
>> >because the hardware has got flaws, because they have what aranym and all
>>
>> Uhm...
>> Well, to each his own.
>
>then please give me a better reason

I really hope there are not many people who use Ataris _because_ they are
slow and flawed. That does not seem like a very rational thing to do.

Rather, I think people are comfortable with the OS, desktop and
applications they use, for example. Those things would mostly behave
exactly the same, only much faster, under ARAnyM.

I don't really _use_ my Atari computers and almost never have, even
when they were the only ones I had (the same applies to the rest of
my computers for that matter, unless you count Web browsing and
connecting via telnet/ssh to external machine as 'use' (well, I do
play games occasionally)).
I do most of my programming for them, though. Mainly because I have so
far had interesting and reasonably meaningful things to write for them.
I've never really had any major preferences for one GUI over another,
and I've always found large parts of the TOS/GEM internals pretty much
appalling. The 680x0 processor is pretty nice, though (I came from
the Sinclair QL, which also used a 68k, to the Atari ST), and with

the Falcon there was finally an Atari machine with some interesting
hardware to play around with.
I don't think I'm a very typical Atari 'user', though, and for that
matter I might have have been happier with an Amiga (which has
a pretty decent OS, apart from the lack of memory protection). The
reason I didn't end up with an Amiga was actually partly your 'slow
and flawed' argument, which is a bit funny (I didn't want a decent
blitter chip, since I liked optimizing graphics routines ;-), but
the main reason was the monochrome Atari monitor (SM124).
It's somewhat telling that the first program I wrote for the ST was
an 'emulator' that made it possible to run the Sinclair QL OS on it.

>> For that matter, I have personally never understood how people see
>> a difference between a 'real Atari' and a mostly perfect emulator,
>> as many of them are.
>
>you just dont get it do you.. why do ppl perfer the real thing before a
>mostly perfect emulator? I think you answered your own question.. there is
>no such thing as a perfect emulator and I dont think there will ever be
>one.

What do you find imperfect about the emulators?

I would not consider lack of support for some esoteric game/demo code a
valid argument, since those things do not work on most real Atari
machines either. The ST emulators are definitely much more ST compatible
than a Falcon or TT, not to mention a Hades or Milan.
To some people the lack of MIDI support, or perhaps the Falcon's DSP,
is a problem, but those should be a small minority.

Even ARAnyM, which does not really attempt to emulate an Atari machine,
should run the vast majority of Atari applications.

Wow! That was incredibly cheap, to say the least!
He should easily have been able to get more than twice that.
Of course, some people are just kind (or don't know what they've got).

I just looked at some old messages there and noticed a 14/200 Falcon
(with two cheap monitors) going for over 200 UKP a year ago, so it's
not like they are all cheap.

>new) from indigo in denmark for 2000sek, 1 from a good friend of mine for

Very nice.

>1000sek, another one from a guy who I knew since a couple of years for

I think Standa is the first person I've known who has sold a Falcon. ;-)

Buying from friends is of course a good idea, when possible. My old
PCs tend to be on 'extended loan' until they are difficult to even
give away.

>100ukp, 1 falcon in a tower from ebay.de for 150ukp.. thats five..

OK. I see that it is indeed possible.
Among the things you mentioned, only eBay.de is really a viable
option in general, but I'll most certainly keep it in mind in the
future. When I've looked there earlier, the interesting things have
mostly been available to Germany only, though.

Well, at least I've gotten most of the rest of my machines cheap.
I might try to pick up yet another Falcon later if and when I see
one around 100 UKP.

>and IRC is the place to get to get to know atariusers btw.

I've tried IRC a couple of times (several years ago now) but couldn't
stand the horrible signal to noise ratio. Seemed like a couple of
orders of magnitude worse that Usenet.

Not quite. It has been ported to run under Windows, using the Cygwin
Unix compatibility library.

>If so, does that mean it could be run on a Power Macintosh running
>Linux or maybe even OS10 which is loosely based on BSD?

I don't think anyone has ported it to that yet (I've been planning
to set up Linux on my old PPC Mac, but have not gotten around to it).
There's absolutely no reason why there should be a problem porting
it, however. I'm pretty sure Basilisk II, which uses the same CPU
engine, has been ported to those platforms.
At the moment, I don't think the JIT is available for anything
except x86, but that doesn't yet work under ARAnyM, anyway.

That was a slightly different version again. It was called the 1040STe+. A prototype was pictured in the Rev. 10 Best electronics catalogue. If there was more than one prototype perhaps someone else has one of those rare machines as well. It also had a small hard disk mounted internally as well.

186. Falcon and IDE hard drive!!!

Message-ID: <1023486992-724950AEicMi@williams-net.com>
Source record: 34340

Anyone,
I bought a 40 GB 7200 RPM IDE MAXTOR model number D740X-6L. Ever since I installed this hard drive, I have always had to start my system up twice before being able to do a complete boot up the second time. I have the MAXTOR 40 GB hooked in second on my IDE chain, (the smaller 84 meg IDE is first for bootup files) and the power is supplied by my PC tower to the IDE MAXTOR hard drive. There is only 2 ways that I know of to get my MAXTOR to work.

1st way to bootup
BOOTUP to the XBOOT screen then shutdown and reboot and everything will be ok!!!! (This allows the MAXTOR hard drive to spin up on the first bootup so that all partitions will be recognized on the second bootup).

2nd way to bootup
Once I have the power turned on to my PC tower unplug the 40 pin IDE ribbon cable to the MAXTOR hard drive and the MAXTOR hard drive will begin to spin up and it can be booted with NO problems.

My problem with the 1st way is it is time consuming 20 to 30 seconds everytime I want to bootup. Not to mention wear and tear on my Falcon. The second way could really wear out my ribbon cable not mention my IDE MAXTOR hard drive.

Is there any solution that could resolve this problem???????

Thanks,
Carey Christenson

Hello STan,

s> I would say that if everybody moves to ARAnyM, EmuTOS, fVDI, FreeMiNT
s> and XaAES then we all would profit from that with having a great bunch
s> of new modern applications. All the missing features will be implemented

well, I'd like to use it on iBook 'on top of' OS X. How far? Can I reach
USB-Printers there?
Can I use PureC then? /Then/ I'd like to support a bit too ...

(ok, I did not search first ..)
I'm not used to Gnu C yet. Maybe someday I reach it. ;-)

Yes, I want to continue with multitasking Atari soft. But I expect
OS X eating it up.

BTW, I have ISA-Interfaces on my Atari-Hardware (Mega/PAK etc.) and some
ISA Ethernet-Cards, none of them with ready-to-run drivers. I've
looked at some driver sources already, hmpff. I guess soon I'm going to
ask for more support bringing up one of the cards for peer-to-peer
TCP/IP. I expect mixing C and assembly.

By the way, Ctirad, what is the status of the preparation of a mentioned
mini-linux selection for starting ARAnyM practicaly from (0,0), as Joshua
would like? Ok, I know I could browse for the news at Aranym web page, but
it is easier to ask this way :)

As for BIOS chips, Joshua... AFAIK the routines in that same chip are used
to start booting -any- operating system on a PC (e.g. DOS, Windows, Linux,
QNX...), but this does not mean that those OSes are run on "emulator".
Once loaded, the OS can even use its own low-level routines and never address
the chip anymore. And if, e.g. the minimum set of linux or whatever else is
loaded just to start Aranym, I don't see any logical (psychological?) problems
with that. E.g. I work daily on a nice Alphaserver DS20E running OpenVMS 7.21
which is a very mature, reliable and secure operating system. The system is
booted from a "console" firmware which has a quite comprehensive command
language, can perform a number of operations and includes even some basic
network capabilities- practically an OS of its own. But that does not make
that machine an "emulator" for loading OpenVMS.

Hmm, I might one day try to compile Aranym on that Alpha :)
There are C++ and Decwindows (i.e. X-11) on it.

I assume you mean the amount of craptalk you get and thats your opinion,
since I know pretty much all ppl on #atariscne in person I dont consider
this craptalk.

Usenet is a lot worse, its anarchy compared to irc.

I'd always recommend the DDP section of my web site as the best place to download English translations of ASH software. I update them from time to time in the light of experience - although everything has been stable for some time now.

Cheers

Have you tried setting a bootup delay in the Falcon's NVRAM?

>III
> III The High Flying FALCON 030
> /I\ "Soon to be CT60!!!"

Are you certain that the drive you have will be fast enough for this? (I've
no reason to suspect that it isn't BTW).

> tos and freemint platform, since he is quite a bit biased towards aranym I
> can only assume he means abandoning atarihardware to use aranym, which I
> think its sad.
```

The sad fact is, that Atari hardware is dead for a years (don't tell me about a new card called CT60 - there were 68060 TOS machines since 1995 or so) and most Atarians will move to PC+Windoze (many of them already did that) and then left the TOS/Atari platform completely. Aranym gives them the possibility to upgrade at a modern and fast hardware but without changing the platform.

```
> There is no reason to use atari if all you are looking for is speed.

Really ? So for what do you use your Atari ? Retrogaming ?
```

I would like to use my TOS machine for my everyday work, i.e. WEB browsing, DVD/DivX/MPEG replay, video editing, playing cool games under emulators of various machines, etc.. And the speed is the key !
There is thousands of opensource software that can be easily ported onto TOS platform. We have GCC with many important libraries and thanx it it's possible to port many applications without any modification (just type ./configure and make and viola, you have an TOS app :) and many other with only slight modification. Do you want to play Amiga (C64, ZX, 8bit Atari, Coin-up, ST, NES, SNES, Genesis, Lynx, gameboy...) games in the GEM window ? No problem ! But speed about 0-3fps on a 68040/68060 is not very funny :(Same for video codecs. When I found the libavcodec from ffmpeg package I told the author of Aniplayer about it and after couple of days I got a working betaversion of Aniplayer with DivX3/4/5/AC3 support. That is fantastic, though slow on a 68k machines. We can have a TOS version of a new program (or A/V codec) in the same day when it will be available on other platforms. This is the way the TOS platform should go. It has great possibilities, though, it can't fully profit from them because of slow 68k machines.

```
> And why would we bother trying to port mozilla, staroffice and everything
> else and to get it to run on aranym in a win/linuxenvironment at all? its
> avaible for those platforms anyway!

You are confused. Mozzila, Staroffice, wtc. are available for Windows/linux,
but not for TOS platform we talking about.
```

> I know you can use aranym on any
> machine (hence the name..) but I cant see why you would want to run
> mozilla in aranym on a pc which has got a native version of mozilla
> anyway.

You completely missed the point ! PC (or any other computer) itself is only a bunch of metal and plastic without any "soul". To get a complete platform you need to add a "soul" (=OS). Then you get a Windows box, Linux box, Solaris box, BeOS box or TOS box, which are completely different platforms with uncompatible apps, even when it runs on the exactly same hardware. It's same for, say, Falcon or TT. You can use built-in TOS or install Mint of MagiC (well, it's still the same platform) or to install a Linux or BSD which have nothing to do with the TOS OS and apps. But it's NOT an Linux or BSD *emulator*, it's simply an Linux (BSD) which runs on Atari hardware. And Aranym is the same, the goal is a portable TOS compatible operating system, which can be installed on a PC, MAC, SGI, Alpha, PSX2, pocket PC or your toaster. You understand ?

```

It's quite correct. Currently it runs on Linux, BSD, Solaris (AFAIK) ,
SGI/Irix, Windows and MacOS X. The Linux version is most important for
future, though, all other are "side products".

```
> If so, does that mean it could be run on a Power Macintosh running

Aranym runs on MacOS X. Ask Didier Mequignon (author of Aniplayer) for the
details.

it sounds like your Maxtor is set up so that it's parked when it
shuts down, that's why it's not being recognized on the first boot. I
recently had a problem with a 4.3 gig Quantum drive I've installed
inside my UMAX Mac clone that is similar to yours, it was just a matter
of installing a jumper on the proper pins to defeat this feature. You
might want to check for any info on the drive or its documentation if it
has a "park" feature, and if it can be shut off.

There are lot of problems with SDL (keyboard, mouse, fullscreen). I'am
sorry but today I use always MagiCMac because without JIT Aranym is too
slow on my iMac (a PPC G3 500 MHz). For play divx MagiCMac is 12 times
faster than Aranym under MacOS X
And don't speak to me a PC solution, a PC is always a PC (I hate PCs, I
use this machines at my factory, it's enough).

Regards,

Didier.

For the CT60 it's was not possible because I'am not sure than you can
found SD-RAM in 1995.

Hi Ctirad, you're crasy ???
I obtain 2 frames/s for play a divx movie in 352 x 288 on my Falcon/CT2
and the MP3 track played by the DSP.
I obtain just 1,6 f/S on my PPC G3 500 MHz with Aranym and _without_ MP3
track played.
Do you think than the CT60 is just 2 times faster than the CT2 ?
I'am not sure :-)))
The CT60 can use the DSP for play the MP3 track, it's not the case of
Aranym.

You must understand than the CT60 is faster than an Hades 060 or an
amiga 060 card because There are no SDRAM and DSP on this machines.

Regards,

Didier.

>therefore I bought LIBEDIT afterwards, a program from the AUGUR
>package in order to manipulate the SYNTEX made fonts...>

IIRC, AUGUR/SYNTEX differed from other OCRs by recognizing the
shapes of the strokes and curves making up characters, rather than
matching bitmap masks, which needs different libraries for
different sizes as well as different fonts. In other words, the
reverse of the process used for scalable vector fonts by
SpeedoGDOS and NVDI. Did LIBEDIT just add extra characters, or
primitives?

Does this mean that it could be ported to the Amiga? Basilisk 2 is available
for AmigaOS (the author has written another Mac emulator for the Amiga before,
too), and I wouldn't mind running MiNT from time to time on my A4000.

I agree. But at least it could be a unique piece of hardware instead of an
emulator running on top of a (n albeit trimmed down) host OS.

>Up comes something that will to all intents and purposes be a very fast
>Atari compatible machine. There will of course be a Linux kernel (or
>something like it) underneath, but you'll never see it.

OTOH, Amithlon is a moot point today. There are new Amiga computers coming
out, and they run a native OS on their own hardware.
I personally couldn't cross over to Amithlon, since I'd just be bothered about
a processor running at over a gigahertz spending most of its time emulating a
68000. It's very fast in 68000 terms, but nowhere near a 1 GHz 68000, if there
were such a beast.
Ideally, ARAnyM should run native on some piece of hardware of choice, instead
of as an emulator.

Besides, running Mozilla or StarOffice is not a matter of hardware, or even emulated hardware. It's a matter of porting the damn things, and that's an entirely different mess. The only way in which ARAnyM would affect that would be to speed up the compilation process until it comes to a screeching halt because of incredibly tangled-up code and dependencies.

>What do you find imperfect about the emulators?

It's true, an emulator can never be perfect. There's a big difference between MAME and an Asteroids machine, for example. But that's no big deal.

Dr. Thomas Redelberger (IIRC) has written an Atari client for the UNIX LPR network printing protocol. If the Brother printer has a network interface and supports LPR, that should work. Or if you place it on a printer server which speaks LPR (I can recommend Intel's printer servers, they speak every single protocol in existence, or you could set up some UNIX box to drive it), that should do it, too.

Every Horse has an Infinite Number of Legs (proof by intimidation):

Horses have an even number of legs. Behind they have two legs, and in front they have fore-legs. This makes six legs, which is certainly an odd number of legs for a horse. But the only number that is both even and odd is infinity. Therefore, horses have an infinite number of legs. Now to show this for the general case, suppose that somewhere, there is a horse that has a finite number of legs. But that is a horse of another color, and by the [above] lemma ["All horses are the same color"], that does not exist.

In case you don't check TAT very often, here is a list of articles that
have been posted since the last posted update (March 15!)

Updates to http://www.ataritimes.com since March 15, 2002 -

* 2600 Reviews:
SeaQuest
Xenophobe
Galaxian
Robot Tank
Empire Strikes Back

* Arcade Reviews:
Indiana Jones and the Temple of Doom
Pong

* Reveiw of Jaguar Zero-5
* Review of Lynx Paperboy

* TAT Editor in ST-Computer
* Dear Fruitman
* Atari & the Star Wars games
* 7800, A Magnet for Arcade Ports
* The Hot Spot by Bart Harrison

Check out the new look of the site, and don't forget to vote in the
polls!

Note: Many of the stories have scrolled off the main page. Be sure to
check the "MORE HEADLINES" link at the bottom!

>
> Hi Ctirad, you're crasy ???

Yes, a bit ;)

> I obtain 2 frames/s for play a divx movie in 352 x 288 on my Falcon/CT2
> and the MP3 track played by the DSP.
> I obtain just 1,6 f/S on my PPC G3 500 MHz with Aranym and _without_ MP3
> track played.
> Do you think than the CT60 is just 2 times faster than the CT2 ?

I never said that. I spoked about speed of such appliacations (emulators,
video) in general.
For me it's not important if the movie runs at 2 or 5fps or even 10fps,
beacause the result is allways the same: unusable.

> The CT60 can use the DSP for play the MP3 track, it's not the case of
> Aranym.
> You must understand than the CT60 is faster than an Hades 060 or an
> amiga 060 card because There are no SDRAM and DSP on this machines.

It's perfectly clear for me. However, you can not expect a 10x faster CPU
power than from other 060 solutions. And this is a minimal power you would
need for tasks listed above.

Ctirad

214. Ultimate Virus Killer (UVK) for Atari ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 2002-06-09 11:35:14 UTC
From: Richard Karsmakers <sorry@no.spam>
Message-ID: <raf6gu4kajv5kicbgudnbcg2g81ugftjjd@4ax.com>
Source record: 34269
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

215. STNICCC / Atari 16-bit Scene Central site

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000? Or were you an otherwise active member of the aforementioned scene?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

> MAME and an Asteroids machine, for example. But that's no big deal.

Sounds crazy. You can't compare an arcade emulator which precisely emulates
every bit of the original machine with the Aranym (or Amithlon) which
emulates mostly the 68k CPU. And in additon I belive in futere there will be
a possibility to run a native applications, so the 68k emulation will be
used only for "old" applications from the 68k Atari machines.

> And don't speak to me a PC solution, a PC is always a PC (I hate PCs, I
> use this machines at my factory, it's enough).

I understand that someone can hate Windoze, Linux or DOS. But to hate PC as
a
hardware ? Strange.
You speaking SDRAMs, that's PC technology. You have a PC harddisk in your
Falcon and PC SIMM in your Centurbo. You looking at a PC monitor connected
to your Falcon. Many users have its falcons in PC towers, other ones use a
PC graphics card, PC networking cards or even PC mouses and keyboards.

If you ask any Atarian what would the new TOS computer look like, he answer:
AGP, PCI, PS/2, SDRAM, USB, firewire, ethernet, etc. In fact everybody wants
a PC hardware as a new Atari machine, only with different name sign on the
box.

Hi Grzgegorz,

>So maybe the English RSC from D&D website works only with the latest
>Papillon?

Apparently so...
But isn't that normal? the last update of Papillon is three years old ,
people really should have updated their older version by now, we try to
provide translations for the latest versions.... as much as possible.
If we translated an earlier version of an app , that translation will
remain on the website (i.e Jinnee, Emailer, Magic etc...) but IIRC this
particular version of Papillon was the first one we've tackled.

Off topic:
I quite often receive mails from people asking if we intend to translate
Texel 2.2, we really would but we don't have it....
Unless the authors or softwarehouse mails us a beta to translate, we have
to buy the apps ourselves.
Neither Derryck, Peter or me can use this program, so bying Texel 2.2 just
for the sake of translating it, is somewhat over the top....
Unless someone out there who really wants to see this app translated
mails it over then I'm afraid it will never happen and the same applies
to other so far untranslated software. We're quite dedicated but there
is a limit ofcourse :-/

Cheers from Belgium
Dennis

Hi Martin,

>Just installed an official full version of Papillon 3.04 (German).
>I tried to replace the RSC files with the translated english ones from
>D&D. But with these resources Papillon quits automatically right after the
>appearance of the opening screen. The strange thing is that these same RSC
>files worked perfectly with the Papillon 3.04 demo that I tried first.

First, compare the size of the binary; PAPILLON.PRG should be 468.285 bytes
long and be from 09.03.1999....

Secondly, check out Derryck's website (see signature) and get the latest
version of the Papillon 3.04 translation, the package now contains a patch
which translates the German text strings in the binary also...

>What to do to make the English RSC files work with my full version
>Papillon 3.04 ?

Actualy, you're the very first who reports a problem with this translation,
AFAIK the translation is for version 3.04, I remember that back when we
translated it Oliver Buchman from ASH told us that this was the latest (and
last) version of Papillon....
Anyway, it's no big deal really, I'll contact you by email and we'll sort
this out in no time ;-)

Cheers from Belgium

>OTOH, Amithlon is a moot point today. There are new Amiga computers coming
>out, and they run a native OS on their own hardware.

As always, I believe such things when the machines are actually
available. It's not like it's the first time there was to be a grand
new beginning for the Amiga.

In any case, those machines should be much more expensive than using
Amithlon on standard PC hardware. They may be faster, but by how much
remains to be seen.

>I personally couldn't cross over to Amithlon, since I'd just be bothered about
>a processor running at over a gigahertz spending most of its time emulating a

But it, arguably, isn't.
Amithlon is using a JIT 68k->x86 'compiler'.

>68000. It's very fast in 68000 terms, but nowhere near a 1 GHz 68000, if there
>were such a beast.

Actually, going by the benchmarks I have seen, it is a lot _faster_
than a hypothetical 1 GHz 68000.

If you take a look at http://www.amithlon.com/product-amithlon-e.html
you can see that for the benchmarks they run there, it is generally
running as quickly as a 400-800 MHz '060. And the '060 is of course a
lot faster than a 68000 clock for clock.

>Ideally, ARAnyM should run native on some piece of hardware of choice, instead
>of as an emulator.

I'm not clear on what you mean by that. Without some kind of m68k
emulation, it is obviously not going to be possible to run any current
Atari programs, which kind of defeats the entire idea. The emulation
of other hardware can approach nothing with proper support in EmuTOS.

As someone (Ctirad perhaps?) mentioned earlier, it is not outside the
realm of possibility that it might one day be possible to run native
mode (x86, PPC or whatever) programs inside ARAnyM, if that was what
you were referring to.

>Besides, running Mozilla or StarOffice is not a matter of hardware, or even

No, it is a matter of performance.

>emulated hardware. It's a matter of porting the damn things, and that's an

I doubt anyone will bother even trying until there is some way to
run these things at better than a snail's pace.

>entirely different mess. The only way in which ARAnyM would affect that would

We already have X running under MiNT, which is reasonably POSIX
compliant, AFAIK. MiNT itself might need to be updated a bit (real
threads might be needed), however.

There should be nothing terribly strange about these kinds of programs,
and they have after all been ported to all sorts of hardware and OSes
before.

>be to speed up the compilation process until it comes to a screeching halt
>because of incredibly tangled-up code and dependencies.

What makes you think these programs are that bad?
Star Office was written by professionals and ported to various different
systems, so I really doubt it can be too bad. The GIMP was pretty nice
when I last looked at it, and I really doubt a project like Mozilla
hasn't been very carefully handled.
I have never looked at Star Office or Mozilla myself, though, so it is
entirely possible that I am wrong.

>>What do you find imperfect about the emulators?
>
>It's true, an emulator can never be perfect. There's a big difference between

It can 'easily' be perfect at the OS level.
If you are talking about playing games and watching demos, that has
nothing to do in a discussion about the future of the system.

I've always wondered why no one has ported MiNT to the Amiga. I can't
believe it would be very difficult, considering that it was ported to
the Mac.

Nowadays, with EmuTOS, fVDI and XaAES, it should be reasonably easy to
get an entire TOS/GEM working on the Amiga, without any slow-down
whatsoever.

In my view - what is meant with "PC" is "Microsoft-driven architecture".

The components you are listing above are all used /on most platforms/
independent of architecture - they are without that "monopoly-taste",
which in my opinion is the problem of "mainstream architecture".

I think, with athlon the PC-hardware-problem has softened a bit (no
more Intel alone), and Linux and the other open soft operating systems
offer a lot of opportunity to leave the babylonian prisonship *) of
microsoft ...

(now, OS X has an open base on BSD-unix, nice).

But to talk ATARI: it is very difficult to go on with tuned hardware
(in low production numbers!) alone, so every base for future
atari-soft deserves support. Of course, interchangeability and
usability on all emerging TOS-derivatives should be pursued, and
I think at the moment we are not too comfortable about the
situation.

Servus
Franz

*) maybe its risky to use such expressions in foreign tongue?

I do hate the old x86 architecture (but x86-64 (Hammer) is looking good).
However, given the very large market share it has, Intel and AMD have
been able to do things with it that I think few believed possible.
Today I see very little reason to use any other architecture unless
you are in the high-end server market, doing embedded systems, or need
a low power chip.

The rest of the hardware in current PCs is mostly pretty good.
PCI, DDRRAM, HyperTransport, IDE, USB 2.0, etc.

There is some unfortunate legacy stuff in there (non-PCI IO and the
interrupt controller to name two), but at least it's mostly hidden
inside the chipset.

Source record: 34284

From: Stanislav Opichal <stop@systinet.com>
Date: Fri, 07 Jun 2002 10:08:43 +0200

Hi Stanislav,

>Please think about it at least for 10minutes before you reply.

I reflected three days over it....

>As far as I can say there are a very few people developing FreeMiNT or TOS
>software. I know MagiC has something that FreeMiNT doesn't, but it is death
>just because it is commercial and the comunity (the ASH market) is shrinking.
>

Come again?
Are you telling us MagiC is dead? Perhaps in your wildest dreams it's dead but let me assure you that it's not. Development of MagiC X is almost finished and the next thing on the "to do" list is the Atari version... Andreas Kromke has only two hands and MagiC is developed by him only, not a team of programmers. So MagiC being dead is just wishfull thinking on your behalf.

>FreeMiNT and the open-source projects are live. There are developers who
>dedicate nearly all thier spare-time for it.

FreeMinT is just an OS. Without apps written specificly to take advantage of its features one can just as well use MagiC. As for these brave souls that dedicate all their spare time... bravo!
But once again a OS needs apps to show off its capabilities. Without apps the best OS in the world will only have a small group of dedicated users.

>But you users... you are just continuing to use MagiC not seeing the future.

Yep, but if ever someone out there surprises me with a mind blowing MiNT only application I might give freeMiNT another chance. Until then I'll stick with MagiC with which I can run any multitasking capable application without having to come here nagging about it not working properly. I don't even have to come here asking about the betaversion of QED behaving "strangely".... since under that "dead" OS it works perfectly....

>I'm also very sad that people don't actually see the future of the TOS
>or better FreeMiNT platform. As far as I can see 90% of you all are just
>sitting and watching your MagiCPC or Gemulator screen paying for that a
>fortune and beeing limited to a specific host OS.

The future of Atari and automatically FreeMinT software is just fine. One only has to look at what's been released this year... And even if 90% of the people here would be watching a MagiCPC screen, at least they are watching an Atari app running... will what they watch look any different when it's running under

Aranym?

>I would say that if everybody moves to ARAnyM, EmuTOS, fVDI, FreeMiNT
>and XaAES then we all would profit from that with having a great bunch
>of new modern applications. All the missing features will be implemented
>and everything you will get for free!

Yes ofcourse you would say that....
What about implementing the missing features first and then come raving in
here about it? Also, what makes you think I would want it? I'm perfectly
happy with what I've got and so far an "expensive emulator" like MagiC-Mac
beats the shit out of Aranym if I read Didier Mequignon his posting correctly.

Cheers from Belgium
Dennis

Dobry den, Ctirad!

For my part I don't care *what* the name is - all I would be interested in buying is a faster machine that will run my *existing software*, of which I have 1000s of disks plus dozens of CDs. True, not all run on the Falcon either, but those I use constantly do. I would not want to get used to new ways of working, new shortcuts, desktops, what have you. I even don't use my son's 1.9 GHz PC that's in the same room - though I may use it in future for downloads from the net if I can get a USB -> SCSI adaptor to work so that I can transfer downloads to an EZ135 cart and hence to my Falcon.

I agree with your earlier remarks about modern Falcons and TTs being full of PC components and can't see either why anyone should hate them. Windows is another matter... it's so damn wasteful of resources!

Nazdar!

Derryck,
I have heard that setting up a delay may help with
this problem I am experiencing with my 40GB IDE Maxtor
hard drive!!!! How do you go about doing this??? I
will do some poking around and see if I can find the
item that I need!!!! Thanks for the information!!!

Thanks,
Carey Christenson

You can use the BOOTCONF software for this:

That's not true. When I set my Aranym for first time, I simply took harddrive from my Falcon and used it. There weren't many things to change. I removed only a few lowlevel drivers (nemesis, scc.xdd, videlity) and added Aranym related ones (fastram.prg, fvdi), then I changed my desktop resolution from 800x600x16 to 1024x768xTruecolor and that was all. I keeped all my desktop settings, shortcuts and favourite applications until now. Aranym is much more compatible than any real TOS clone and once I compile the Hatari under TOS/Mint I will be able to run all Falcon/TT unfriendly ST(E) appliactions under a GEM desktop. Then Aranym will be a most compatible TOS machine ever.

Try PARCP (http://joy.atari.org), it's probably the best solution if you want to copy data between Atari and PC.

```
> By the way, Ctirad, what is the status of the preparation of a mentioned
> mini-linux selection for starting ARAnyM practicaly from (0,0), as Joshua
> would like?
```

Well, that's quite far future. Currently there are other more important
things to do:
1. replace copyrighted TOS4.04 by the opensource Emutos (it's almost done,
only the XHDI protocol is missing - In fact it replaces also a
Ahdi/Cecile/Hddriver)
2. finish and debug the JIT compiler
3. ethernet/network driver

```
Perhaps then will be a right time for thinking about a distribution.

Ctirad

We have already done the translation of the text strings including the
BubbleGEM help and the resource file for the never-released and Beta-expired
Texel 2.30, so most if not all of this can be used.

The DDP package would be a diff-type patch to apply to the German binary and
a swop of the resource file.

Cheers

Derryck

If you can organise an Ethernet adaptor for your Falcon (there are a couple around as you'll have seen) and one for the PC, then you can very easily fileshare with Vassilis' Samba port and MagxNet. You can even print to a printer on the PC as well as share an Internet connection. Makes a broadband connection worth thinking about maybe.

Cheers

Perhaps one of the proprietory bathroom cleaners that are rated safe for plastic bathtubs might do the trick, I found Jif or Cif cream as its now known to be quite good, reducing the yellowing but never quite getting rid of it.

Spray painting with a light grey paint - may not be quite as drastic as it sounds, it would require stripping out the workings, - a good excuse for a decent clean of the keys too! I would finish it off with a light coat of matt varnish spray just to flat the finish down, Im going to go experiment on a scrap case Ive got in the attic!

Hey thats not fair ;-) The recent qed changes were developed on MagiC
PC, and for some time I didn't have the chance at all to test it under
MiNT/N.AES. It's absolutely sure that bugs will occur on an OS variety
which you can't test. It's exactly the same if you develop on NT and
can't test on 9x. (Or - god beware - vice versa). MagiC PC shutdown
still doesn't work under NT, because I haven't got the chance to test
it.

All in all I can't really understand what your'e all talking about.
Emus are great, hardware is great, MagiC is fun, MiNT is fun. So what?

That's what we suggest. We never said "go buy a Windows machine and run Atari emulator on it". We say "use current cheap hardware (whatever it is) for running your favorite Atari applications".

I myself built a
machine with AMD Thunderbird CPU in a ABIT motherboard with a nVIDIA graphics card, Seagate harddrive, Chicony keyboard, Genius mouse and some other bits and pieces. Is it a PC? There's no Intel inside, no Windows. And it runs TOS, MiNT and everything else since I copied over my whole Falcon harddrive. I think I even copied over the SPIRIT that was mentioned in other posts in this thread.

Would this make it clear?

Petr

Well, I was VERY surprised to see this post, seeing as how I wrote it
in 1999! What I think happened is that I wrote it and attempted to
post it with Newsie and then didn't use Newsie again until now. It
must have been sitting in the message buffer all this time!

Boy, I hope the CT60 arrives soon -- otherwise I'll have to start
using my other Falcon again.

>Anyone know where to get this anymore? All of my searches have turned up
>dead links!

If you have trouble with dead links, try out www.archive.org.
I don't know how much of the Web they have archived, but at least they
had 30+ versions of my old Web pages, the original Bad Mood pages
among them (http://rand.thn.htu.se).

Not everything from my old ftp archive is available from that site,
unfortunately. It looks like only the stuff that had direct links
from the Web pages is stored. That does include the latest version of
the Bad Mood binary (but not the sources for it), though, v3.07alpha.

I've copied most of the stuff from those old pages to my new server
at http://217.215.149.49, but the Bad Mood archives are not yet up
there. They will be soon, though.
(If someone happens to have the BM v3.07 sources, please get in touch
with me. I'm pretty sure I must have them somewhere, but I can't
find them.)

264. Using PC IDE disk on Falcon...

Newsgroup: comp.sys.atari.st
Date: 2002-06-11 09:04:18 UTC
From: dickdaz <dickdaz@xtra.co.nz>
Message-ID: <F1jN8.2404$iR2.280754@news.xtra.co.nz>
Source record: 34223

Hi there,

I'm looking at putting a large pile of MP3's onto
my Falcon, but need to find a way to do this. They
will be created on a Win98 PC, but I cannot network
to this machine (or fit the files on floppies).

Is it possible (and safe) to grab the PC's hard disk
(IDE unit) and plug it onto my Falcons IDE controller
as a slave unit? If I could do that I could simply copy
the MP'3s directly onto the Ataris existing IDE drive or
SCSI drive (saving massive amounts of time!)

I'm using HDDriver 4.52. I have heard it is simple to
do since HDDriver will happily access the MS-DOS file-
system on PC drives, without nuking the drive. I state
I CANNOT AFFORD TO NUKE THE PC DRIVE SINCE IT IS NOT
MINE! Therefore any advice MUST be 100% accurate and
clear to read!! ;-/

Kind regards,

Chris Wilkinson, Middle Earth, New Zealand.
/|\ ATARI and (soon to be) SGI Owner.

> So MagiC being dead is just wishfull thinking on your behalf.

What do you mean by MagiC X? MagicMac for OS X? OK. If this is true
(and it obviously is as I can see from the ASH update) then OK. One
person working on OS used by many people and close-source. Do you
think he never give it up? What would you do then? Move to your native
Mac OS X. This is what ARAnyM is trying to stop. People are moving
away and not giving their work to anyone else.

> But once again a OS needs apps to show off its capabilities. Without apps the
> best OS in the world will only have a small group of dedicated users.

Yes, this is completely true IMHO.

> Yep, but if ever someone out there surprises me with a mind blowing MiNT only
> application I might give freeMiNT another chance. Until then I'll stick with
> MagiC with which I can run any multitasking capable application without having
> to come here nagging about it not working properly.

There are problems with writing apps for such different OSes as MagiC
and MiNT. It is possible, but you know for sure that if you want to
make use of an OS specific feature than it is problem.

> I don't even have to come here asking about the betaversion of QED behaving
> "strangely".... since under that "dead" OS it works perfectly....

Bad example... as said by Heiko in some followup..

> app running... will what they watch look any different when it's running under
> Aranym?

This seems to be also true. You say MagiCPC. Others are saying I hate
emulators. Hmm. I see this: Programmers moved to emulators to be able
to develop fastly and users do not like them for doing this. But
everyone like QED even when the 5.0 version were built on MagiCPC. So
think about what you really want.

> >I would say that if everybody moves to ARAnyM, EmuTOS, fVDI, FreeMiNT

> >and everything you will get for free!
>
> Yes ofcourse you would say that....
> What about implementing the missing features first and then come raving in
> here about it? Also, what makes you think I would want it? I'm perfectly

Hmm, maybe mr. Andreas Kromke is working on his MagiC as a full time
job. But MagiC would not feed his children once....
ARAnyM is open-source. The developers are fulltime professional
programmers that do not have that much time to develop TOS platform. I
personally work for a company that do open-source and perfectly know
that people can make improvements and send patches. With MagiC it is
not possible at all. Yes, XaAES, FreeMiNT and others needs some things
to be more MagiC/TOS compatible. But with no users there is no need to
implement them. It is just like a circle isn't it?

> happy with what I've got and so far an "expensive emulator" like MagiC-Mac
> beats the shit out of Aranym if I read Didier Mequignon his posting correctly.

Slow. Yes. The only emulates 040 (possibly with MMU), VIDEL and other
things. The only can use e.g. falcon HDD just taken from your F040
tower.
JIT will beat MagicMac. Just stay tuned and possibly help.

BTW: Dennis, I chose you to reply first because the three days were
really good. You were the only person who responded with a good
points.

best regards

>
> well, I'd like to use it on iBook 'on top of' OS X. How far?

OS X.. You need to ask Didier about the building process. Or maybe for
a binary.

> Can I reach USB-Printers there?

AFAICS no ATM. This is the work to be done. Write the fVDI GDOS
printing possibilities. Or just to write NVDI module for ARAnyM to be
able to print.
It is on the TODO list.

> Can I use PureC then? /Then/ I'd like to support a bit too ...

Yes, you can use PureC. There is a patch for it to let it work over
the MetaDOS filesystem developed as a side effect of the ARAnyM
production.

> Yes, I want to continue with multitasking Atari soft. But I expect
> OS X eating it up.

OS X? Just another person to leave TOS? This is the worse thing we can
hear: ARAnyM is slow. MagiC is expensive so I go to OS X/Win or
whatever else....

> looked at some driver sources already, hmpff. I guess soon I'm going to
> ask for more support bringing up one of the cards for peer-to-peer
> TCP/IP. I expect mixing C and assembly.

There is a Enternet card emulation and/or the socket.xdd on the TODO
list. The ethernet emulation was already taken from Basilisk II, but
not working yet.

> tos and freemint platform, since he is quite a bit biased towards aranym I
> can only assume he means abandoning atarihardware to use aranym, which I
> think its sad.

No, I would not force you to move from your Atari to ARAnyM. I'm just
trying to convince people that there _is_ a new TOS compatible that is
faster than others and is for free and open-source. People are moving
to other OSes just because they have no decent WEB browser or other
application they need. This is bad.
ARAnyM, EmuTOS, FreeMiNT, fVDI, XaAES gives an insurrence that it
would never happen to lose the sources to be improved. We are too
little to rely on a closed-source OS IMHO. You don't have to agree
with me in all points. ;)

> > I think he is thinking along these lines:
> > Once the JIT starts working properly, ARAnyM will be way faster than
> > any Atari compatible machine (it should be close to or faster than an
> > '060 machine even now on fast x86 hardware).

This is exactly what I mean. I already have faster TOS compatible than
ever.
What I want more? I'm of a quite the same type of "user" as Johan. I
don't really use my Atari (I still have 2 of them at home). I like to
program for it. But if there is no comunity to write programs for...
people are leaving.

> machine (hence the name..) but I cant see why you would want to run
> mozilla in aranym on a pc which has got a native version of mozilla
> anyway.

Hmm, we don't want to use another OS. I just want to have my
TOS/FreeMiNT and browse the net with mozilla. With ARAnyM you would
just have PC hardware using your favourite OS - TOS/FreeMiNT or even
MagiC if you want.

> you just dont get it do you.. why do ppl perfer the real thing before a
> mostly perfect emulator? I think you answered your own question.. there is
> no such thing as a perfect emulator and I dont think there will ever be
> one.

ARAnyM is not intended to be an emulator. Yes, in fact it needs to
emulate some things. But there have to be emulated even in your Milan
e.g..

Janka Gerhard charmingly scribbled:

>I'm definitely more interested in Johns information than in your
>'answer'. I bought software from him before and I think there's
>quite some interesting items to be found in his new list too.

Steve S's answer was more than a bit harsh.

John actually made the effort to support one of the Atari Computing shows we organised (unlike many so-called Atari dealers!) and drove all the way from deepest Cornwall to the midlands. He seemed a very nice chap, and he paid all the invoices for advertising with us unlike two well-known Atari dealers.

John's message was so small and pointed you at the full details if you wanted them, I'd hardly call it spamming!

Sorry Steve S, you were unfair in this instance, although I share your views on spamming generally.

Best wishes
Mike Kerslake

Been reading this thread a while. It's worth noting that over the years
I've seen many users leave the scene completely. It's a fact users leave
for whatever reason. To me it seems aranym offers a path that is far more
flexible than magicmac/pc. At least with aranym one can choose an atari OS,
mint, magic, geneva, whatever floats your boat. At least in the end some
user might stay active, produce some software or the like.

Magicmac/pc on the other hand are limited solutions which force
one to use a specific OS, for that reason I never really liked it.
I hope to see aranym out perform magicmac in the end.

If one does not like any of these solutions, one should avoid them.
At least try to see that it might stop some users from leaving entirely.
For that reason it is a good thing.

Hi all,

Does someone actually own the rights to TOS these days since the crash of Atari ?

thanks.

Milan computers in Germany own the rights to TOS.

Joshua.

Hi Heiko,

>>I don't even have to come here asking about the betaversion of QED behaving
>>"strangely".... since under that "dead" OS it works perfectly....

>Hey thats not fair ;-) The recent qed changes were developed on MagiC
>PC, and for some time I didn't have the chance at all to test it under
>MiNT/N.AES.

Well I think it is.... just like the other 90% of the programmers you develop your programs under a MagiC environment. Which automatically means that in the event that there are bugs in the code these wiil be weeded out and/or catched first running under that particular OS. MiNT users don't really like to hear this but the facts are there... the majority of the programmers use MagiC and so do the majority of the users, not bad for a "dead' OS if you ask me...

>All in all I can't really understand what your'e all talking about.
>Emus are great, hardware is great, MagiC is fun, MiNT is fun. So what?

Coming from someone who prefers MagiC-PC over the real thing I find it quite normal that you don't understand my point of view :-)
I agree that the hardware, MagiC en MiNT are fun, but I totally disagree about the emulators... There might be circumstamces in which using an emulator is justified, but to replace the Atari hardware completely in favour for an emulator is IMO ridiculous.

Cheers from Belgium
Dennis

With many of the recent posters being somewhat demanding (to say the least), I thought it might be wise to offer a few words of encouragement. Anyone actively working to improve Atari computing (and by this, I mean the ability to use existing TOS programs and the writing/porting of new ones) deserves our support and thanks.

I foolishly installed RH7.2 without including the compiling options, and since my wife uses the computer for her work I don't dare play with it without very good reason. Thus, I have not yet tried Aranym. Nonetheless, I'm still glad it's there.

> year or so (my guess).

Well, that's your opinion - but there must be a reason why there will
be a new Amiga, C64, CPC and ST soon.

> We came as the first ones and I personally don't
> believe in any further HW to be created on m68k processor.

In fact, TOS2WIN was a virtual machine, too.

> If you want
> to speak about coldfire project or any other falcon speeder like the
> rumorous Tempest then you have to know that this is in fact the same as
> ARAnyM, but only with a different host CPU type.

... there is not a complete CPU emulation neccessary on the Coldfire.
Let's not forget that the Coldfire clone will be unique in many ways
but I don't want to a start a system bashing ;-)

>
> I'm also very sad that people don't actually see the future of the TOS
> or better FreeMiNT platform.

The main reason why I didn't use MiNT/NAES on my Falcon was speed.

> As far as I can see 90% of you all are just
> sitting and watching your MagiCPC or Gemulator screen paying for that a
> fortune and beeing limited to a specific host OS.

MagiCPC delivered exactly what I needed: speed and compatibility. And
there are many programs developed under MagiCPC/Mac.

> As far as I can say
> there are a very few people developing FreeMiNT or TOS software.

I don't develop for MiNT - for N.AES, XaAES maybe.

> I know
> MagiC has something that FreeMiNT doesn't, but it is death just because
> it is commercial and the comunity (the ASH market) is shrinking.

I am not a member of the FreeMiNT project but I don't see that much
development there either (ok, I heard about 1.16).

> FreeMiNT and the open-source projects are live. There are developers who
> dedicate nearly all thier spare-time for it. But you users... you are
> just continuing to use MagiC not seeing the future.

If you want users to move you have to give them something they want.
There are many nice apps available which run best under MagiC or are
MagiC compatible. The freeMiNT world on the other hand has bash,
irc-II and rpm archives. That's fine but just not something that
appeals to the average users.

> I would say that if everybody moves to ARAnyM, EmuTOS, fVDI, FreeMiNT
> and XaAES then we all would profit from that with having a great bunch
> of new modern applications. All the missing features will be implemented
> and everything you will get for free!

I don't think that this will work.

BTW, what I would really like would be a HD image for Aranym which
contains everything to compile programs with gcc.

Greetings,
Matthias

N.AES is not dead. Being the more mature product means that N.AES has
just less bugs and therefore don't need that many bug fix releases.
But development is still continuing.

This is basically possible, but your version of HDDRIVER is most likely
too old for that. (It's so old that I don't know anymore whether it's
sufficient.) If the PC's drive has partitions larger than 32 MByte you
need MagiC or MiNT in order to access them. Plain TOS cannot access
large PC compatible partitions.

>
> The main reason why I didn't use MiNT/NAES on my Falcon was speed.

Yes, now you can use it without worying about the speed. Just have a
fast PC and the faster PC the fast FreeMiNT you have.

> I am not a member of the FreeMiNT project but I don't see that much
> development there either (ok, I heard about 1.16).

Will be better if more people help. There are not many in the world
that are able to design and write OS!

> If you want users to move you have to give them something they want.

This is the thing I'm speaking about all the time. Users stay using
their good old MagiC and it will die in some point in the future. As
fast as Mr. Kromke would not get enough money from it. :(

> BTW, what I would really like would be a HD image for Aranym which
> contains everything to compile programs with gcc.

Hmm, I've uploaded my MiNT image to some people already. It is just
that simple to create this. You just get the EasyMiNT and tick some
checkboxes. After some while you got it. Just try. :)

best regards

You can sometime use an HD disk if you cover the extra hole
that tells the drive its HD. And if you have an STE disks formatted
in that, using the normal desktop formatter to 80 tracks should read find on
a Windows PC.

Hi Standa,

>What do you mean by MagiC X? MagicMac for OS X? OK. If this is true
>(and it obviously is as I can see from the ASH update) then OK. One
>person working on OS used by many people and close-source. Do you
>think he never give it up? What would you do then? Move to your native
>Mac OS X.

Well, I don't give a damn about OS X, and I couldn't care less if there will be a MagiC X or not... but some people obviously do.
Far more important is that development of the Atari MagiC continues, the fact that MagiC is closed source doesn't bother me at all. If tomorrow Andreas pulls the plug on MagiC that doesn't automatically means the end of the OS. It will take many years before it really will be outdated and superseded.
Just like there are a lot of people still using older versions of MiNT, there's also quite a big bunch of MagiC users out there that haven't even upgraded to version 6.0, these people are using an OS that clearly has been superseded but obviously that doesn't bother them. As for MiNT, I know a couple of guys who still use MultiTOS...
As a developer you probably assume that everyone out there is waiting inpatiently to get the very latest version of an application, but the majority of the users seem to think differently. Pronouncing an OS dead is ridiculous... as long as there are people out there using it, it is alive, even TOS is still alive.... ;-)

>This seems to be also true. You say MagiCPC. Others are saying I hate
>emulators. Hmm. I see this: Programmers moved to emulators to be able
>to develop fastly and users do not like them for doing this.

Jinnee, ASH Emailer, Artworx and numerous other apps have been developed under MagiCMac. But that doesn't mean that they only run properly under an emulator.
The programmer of Emailer for example moved to a Mac back in 1995, in those days for someone wanting pure speed that was the only option, in the meantime we've seen things like the CT-2, Hades, Milan etc come and go. Someone moving to another platform only for speed-wise reasons these days is talking nonsense... I've got a Mac here which I use to browse on Internet, burn CD's at high speed, and to use applications which are not available on this platform. And yes... when running MagiCMac it emulates a lightning fast Atari, so what?
That kind of speed is only usefull for certain apps, I'm typing this post on a TT right now, if I would do it on the Mac... it would take exactly

the same amount of time, the speed of typing is something which (so far)
a processor has no control over ;-)

>But everyone likes QED even when the 5.0 version were built on MagiCPC.
>So think about what you really want.

Well like usual I'm the odd one out.... I don't like QED, I prefer Luna
which IMO is far more advanced and has lots more features.

On what kind of platform and OS, QED has been developed doesn't matter,
it's ment to run on a Atari TOS compatible OS, if Heiko wouldn't have
told us that it's developed under magiCPC we never would have known. It's
not really important IMO.

>>Yes ofcourse you would say that....
>>What about implementing the missing features first and then come raving
>>in here about it? Also, what makes you think I would want it?
>
>Hmm, maybe mr. Andreas Kromke is working on his MagiC as a full time
>job. But MagiC would not feed his children once....

AFAIK Mr. Kromke has a daytime job, I don't know how and what he feeds
his children but if its from the revenues of MagiC, I feel very sorry for
these children... let's organise something, so that these children get at
least one decent meal a day :-)

>ARAnyM is open-source. The developers are fulltime professional
>programmers that do not have that much time to develop TOS platform. I
>personally work for a company that do open-source and perfectly know
>that people can make improvements and send patches. With MagiC it is
>not possible at all.

Yes and no...
Because MagiC is closed source and controlled by one person only its
indeed not possible to implement improvements or patches, but one can
still suggest improvements to the author. If he thinks it's a worthwhile
addition he'll implement them... Suppose, you write an improvement for
MiNT, but the maintainer(s) think it's crap and refuse to implement it?
what are your options?

Open source has advantages, but nobody ever mentions the disadvantages,
what about the people who made "improvements" which were rejected by the
group? In the worst scenario, some of them have turned their back to this
platform... another thing with open-source is that it tends to grow into
a resource & memory eating monster, all these little improvements in the
end make it impossible for someone with only a 4MB computer to keep on
using it... and there are a lot of people with that kind of setup around.
Look at what a monster Linux is right now, and it's still growing!! if no
one has the sense to say STOP... it will become even more sluggish in a
couple of years then the Windows and Mac OS put together.

>Yes, XaAES, FreeMiNT and others needs some things to be more MagiC/TOS
>compatible. But with no users there is no need to implement them. It is

>just like a circle isn't it?

Not really, the way I see it is like this:
Whenever something new is developed and released, it is being compared to what's available, which is a normal human reaction. So, Highwire simply will *have* to be better then CAB, XaAES wil need to be better then N.AES, fVDI will have to be better then NVDI etc....
When these new developed apps don't offer anything new and/or are not as good as the app they compete with then it's quite normal IMO that there won't be many people using it. The only way to break that vicious circle is to produce an app which truly is a replacement.
Let's face it: fVDI is a nice app, but I still need NVDI to print, NVDI also supports my NOVA card, and a lot of apps support the Nova card, so unless fVDI offers me the same features as NVDI, I don't consider using it. Not because it's no good but simply because the "original' is better.
So the developers of new applications are facing a hard time, I realise that it's not easy to produce something which blows the competition away, but that's exactly what needs to happen if you want to see more people using the new apps.

To stay on topic:
IMO ARAnym is an emulator, you may call it differently but in the end it's an application with which it's possible to run a TOS compatible OS on a non-TOS compatible platform. That's exactly what an emulator does. ARAnym may have a different way to achieve its goal, but the end result is not really different then with for example MagiC-PC or Gemulator. So comparing ARAnym directly with MagiCPC and /or Gemulator is humanly understandable.

>JIT will beat MagicMac.

It might beat it speedwise but that is not really an important factor anymore, on a recent PPC, MagiCMac emulates at speeds of 200X a TT, once we're talking about these kind of speeds, it's unimportant if JIT is even twice as fast. Much more important is that just like MagiCMac it's able to address the Mac hardware and use it to its full advantage. Oh, and it must be just as stable ofcourse ;-)

>Just stay tuned and possibly help.

I'll stay tuned... I always do.

Cheers from belgium

>Magicmac/pc on the other hand are limited solutions which force
>one to use a specific OS, for that reason I never really liked it.

MagiCPC can run *any* TOS version you care to throw at it. One only
has to replace the MAGIC_PC.OS file with a TOS IMG file and rename
it to MAGIC_PC.OS... I thought that this was common knowledge, but it
obviously isn't.

So there goes your argument against using a specific OS, using TOS
you loose the multitasking ability of course...

>Don't rules against commercial sales count??.
>
>
>--
>Regards, Steve S.

Ah the words commercial, I don't think i come into that category yet.

I'm not sure if John does either with Atari stuff. I can remember a few
years ago that he was clearing out his Atari stock! Maybe that's why he
said he is sticking them on ebay in bundles of 10!!!

I wasn't aware that the group had rules, as such, I know about the
attached file rule as it isn't a binary group. Where can I find the
rules for the group?

Also, out of interest, where would a commercial person advertise to the
Atari community their wares?

I'm also curious why some people get moaned at and some dont!!! I've
seen adverts for several commercial biz over the years; eg. Barry at the
keyexchange etc... but they didnt get any stick. Notice i didnt mention
bravo sierra (cause his adverts are the same over and over....).

I'm not particularly moaning at anyone, I just want to know what to
avoid and prevent people moaning.

AFAIK, that is correct. Milan does not have the copyright (except for our
own extensions), but only a license for TOS.

> is ridiculous...

It depends on the open-source opinion you have.

> as long as there are people out there using it, it is alive, even TOS is
> still alive.... ;-)

Yes, ARAnyM can drive them all. ;)

> go. Someone moving to another platform only for speed-wise reasons these
> days is talking nonsense...

Well, maybe nowadays. But in the future there will be no TOS, MagiC, but
only ARAnyM+FreeMinT. Don't count my words it is just the idea of that
the close-source will never be published when the developer moves away.

> I've got a Mac here which I use to browse on
> Internet, burn CD's at high speed, and to use applications which are not
> available on this platform.

Yes, this is what the _real_ atari only user would never do. He would
like just to have his TOS compatible and have the applications for this
all under TOS. But these times are gone it seems to me... :(

> That kind of speed is only usefull for certain apps, I'm typing this post
> on a TT right now, if I would do it on the Mac... it would take exactly

Maybe you, but many others do not have/or like Mac, Windows, but only
TOS, MagiC or FreeMiNT. They don't want to see any other OS on their
computer. This is the intention of ARAnyM in the future.

The thing I'm trying to say is that it is important to choose the TOS
compatible platform that has it future as free. And make it as much
compatible to TOS and also MagiC as possible.

> Well like usual I'm the odd one out.... I don't like QED, I prefer Luna
> which IMO is far more advanced and has lots more features.

Yes. I really like Luna too. But as long it takes ages for it to start I
prefer to use QED as an editor. Moreover it is open-source and I can
implement what I need. Maybe Luna will be open-source too sometime in
the future... The other thing is that it is in GFA. Which is not very
comfortable IMO to develop in.... I had an idea to write the GFA
compatible language sometime ago, but it went away as the sparetime is
shorter....

> told us that it's developed under magiCPC we never would have known. It's
> not really important IMO.

Sure. This was just an example that using an emulator is also good for
the platform...

> AFAIK Mr. Kromke has a daytime job, I don't know how and what he feeds
> his children but if its from the revenues of MagiC, I feel very sorry for
> these children...

I would feel the same.

> let's organise something, so that these children get at least one decent
> meal a day :-)

Well, I thought you've paid for you MagiC copy. ;) I would rather pay
for open-source MagiC... this is not a reality so I'll try to improve
FreeMiNT.

> Yes and no...
> Because MagiC is closed source and controlled by one person only its

The same as using MagiC and trying to do the same. Actuall there are
more bacause you can use your own version and spread it over people who
like it.

> Open source has advantages, but nobody ever mentions the disadvantages,

> couple of years then the Windows and Mac OS put together.

This is just complete rubbish.... Yes, the rejections might happen. But
if there are these rejections also in MagiC then you would be stucked
the same way. And the rejections are there. You'll send an improvement
and the other person would say it his idea and would get paid for that.
I don't like closed-source commercial software for this. I don't want to
judge Andreas here. These are just an examples.

> Not really, the way I see it is like this:

> will *have* to be better then CAB, XaAES wil need to be better then N.AES,
> fVDI will have to be better then NVDI etc....

Yes, this is true, but only for the platforms where the app does work
properly and gives you more possibilities than the other more widespread
one.

> When these new developed apps don't offer anything new and/or are not as
> good as the app they compete with then it's quite normal IMO that there
> won't be many people using it. The only way to break that vicious circle
> is to produce an app which truly is a replacement.

Not really. As I've said you have to do this only for apps that really
supports all you need. But e.g. in the NVDI case there will be no more
drivers AFAIK except a possible MagiCMacX ones. No native ARAnyM drivers
etc. Why? Just because of the lack of time and no money effect IMO. :(
I know I can write the NVDI driver for it. But I did not jsut because I
want to have free platform a I already have it. No copyrights, jsut
(L)GPL. Many users just don't care, but I do because I work as a
programmer and I really know the price for the sotfware.

> Let's face it: fVDI is a nice app, but I still need NVDI to print

Just not implemented yet. Yes, if you'll be interested you can design
and programm a print driver for sure.

> NVDI also supports my NOVA card, and a lot of apps support the Nova card,

Yes, this is a matter of the drivers. If you use the real hardware
you'll need the drivers. For ARAnyM there is only one which is quite
functional at the moment.

> so unless fVDI offers me the same features as NVDI, I don't consider using
> it.

Understood. With ARAnyM you would not have any other chance simple
because of me. ;) I don't want to bother to support a death NVDI. But
nothing is going to stop you if you implement a native ARAnyM NVDI
driver. Behne brothers gave quite a good feedback about how to do it,
but I just don't want to. It would be happily accepted to the CVS if it
works.

> Not because it's no good but simply because the "original' is better.
> So the developers of new applications are facing a hard time, I realise

> ARAnym directly with MagiCPC and /or Gemulator is humanly understandable.

Yes, sure. In fact it is emulator. But it is considered to run as a
fullfeatured OS that really boots just like your Windows or whatever do
you use. You may have only ARAnyM on you PC and this is the intention to
provide TOS compatible HW for the rest of the comunity instead of
creating new hardware and writing new drivers for it again and again.

>>JIT will beat MagicMac.
>
> It might beat it speedwise but that is not really an important factor
> anymore, on a recent PPC, MagiCMac emulates at speeds of 200X a TT, once
> we're talking about these kind of speeds, it's unimportant if JIT is
> even twice as fast.

Someone did complaing about the speed. And if noone then I would always ;)

> Much more important is that just like MagiCMac it's able to
> address the Mac hardware and use it to its full advantage.

Yes, the ARAnyM's uderlying host OS does provide this quite well and so
it is only a matter of the TOS/MagiC/MiNT drivers to propagate this further.

> Oh, and it must be just as stable ofcourse ;-)

Sure. ARAnyM is still in an early stage, but for sure more stable than
MagiC on my Falcon I had. Maybe MagiCMac is different, but I don't care.
Now I have more compatible, faster and FreeMiNT capable machine here
which is the thing I always wanted.

>>Just stay tuned and possibly help.
>
> I'll stay tuned... I always do.

I would like to encouriage developers to think about the future of TOS compatible apps and join us with the open-source platform creation. We have only 5 or 6 joined this thread which is really not very much having in mind the names of active developers...

best regards

STan

AfaIk there are now formal rules for this particular group at all. At
least there is no published charter that I am aware of. I guess it has
been there too long.

Anyone?

Either serial or parallel "direct" transfer would do. the simpliest solution is to get a nullmodem cable and connect it to the Falcon and pc. Then start a terminal program with Zmodem capabilities on both pc and Falcon. The now free Connect on the Atari side is perfect for this.

I have only used the built in terminal on my Win-95 setup and it is only capable of sending one file and no complete folders etc. so on the the pc you will perhaps need a more functional tool.

This will take a long time to transfer the files but as long as you are not in a hurry, who cares...

```
> IMO ARAnym is an emulator, you may call it differently but in the end it's
> an application with which it's possible to run a TOS compatible OS on a
> non-TOS compatible platform.
```

Oh god... Please, what do you mean by an "TOS compatible platform" ? Is it a machine which can run unmodified ST TOS ? Sure not. Falcon, TT or Milan can't run ST TOS, but they are sure the TOS (compatible) machines.

```
So the right definitions are:

TOS compatible OS = an OS which can run *umodified* TOS applications.
TOS compatible platform = a whatever machine + TOS compatible OS
```

The MAC is a good example. Nowday MAC has nothing to do with any old 68k machines. It's a completely different (uncompatible !) hardware with completely different (uncompatible !) CPU. However, it's still a MAC and you can run umodified applications from the old MAC on it, because there is a backward compatibility in OS API and built-in 68k emulation. But it doesn't mean taht it's an emulator. Got it ?

```
> That's exactly what an emulator does.
```

No, it doesn't. An emulator emulates a hardware, not an OS API. Another good example: There are Linuxes for almost any existing machine. there are Linux for PC, Linux for MAC, Linux for Amiga, Linux for Atari, Linux for PDA or Linux for Playstation2, etc. Linux was originally developed for and on x86 based PC, though. Does it mean that the x86/PC Linux is only the true one and all others are only a Linux emulators ? No ! They are Linuxes as well. Also the TOS OS is still the true one if it runs on ST, TT, Falcon, Milan, xTOS, RISC workstation, x86 PC or some kind of newly developed PPC machine.

```
Ctirad
```

Then you start your own source-tree and users decide which program to use -
an "original" one, or yours.

Or you can just maintain it as a patch.

Hi JI,

JL>I had the demo version (i.e. no dongle) for years and only bought the
JL>complete package (secondhand) a couple of years ago.
a demo used a dongle being present is a full version.

A SYNTEX demo was published by the former Atari monthly /TOS/. That
demo performed exactly as my full version on my 1040.

JL>I wasn't aware that the facility for editing the fonts existed.
That had been advertised by the German distributor and I bought it for
about 130 DM (~60 $ US), I think.

Hi all,

One thing which I still dont get is what the Atari cookie jar is all about ?? Only thing I know is that it wasn't used until latter versions of TOS, I think.

Thanks,
Chris

Why can't you network ? The interface at hardware.atari.org seems to work
well.
If that does not cut it try parcp http://joy.sophics.cz/parcp/ which is what
I used to use before I got my Etheret. Nice interface for copying. I hacked
a
printer cable for the lead.

>I understand that someone can hate Windoze, Linux or DOS. But to hate PC as
>a hardware ? Strange.

"Hate" is perhaps too strong a word. "Prefer an alternative to the Intel architecture" would be better. To my mind (admittedly shaped in the processor wars of the '80s), a unique CPU is part of the charm of having a non-mainstream computer. I am glad to see PowerPC still surviving on the desktop with Apple. I am glad to see Sparc and MIPS still surviving (somewhat). It will be a sad day when all the alternatives die out and the world is entirely a single architecture - even with different flavors of OS. Hence my interest in the development (on however small of a scale) of unique TOS clones.

Thanks Uwe. The PC has a 4GB Quantum with FAT32 and 1 partition, so
I might be better off trying other means. After all its NOT my PC so
if I nuke the disk I'm in TROUBLE! ;)

I just wanted some music in my room (CD-ROM drive is dead), so thought
MP3 would be a interesting option! I cannot find any SCSI CD-ROM's for
sale here anymore (I have found a copy of CD-Tool, but an IDE CD-ROM
I tried didn't work).

Thanks again,

Chris Wilkinson, Middle Earth, New Zealand.
ATARI and (soon to be) SGI owner.

It would be a veeeerrrry long cable..... ;^)

My Atari is now a hobby machine, and I'm not keen on spending ANY
money on it anymore, so buying stuff even to build a cable is not
an option...oh and I'd need to buy a soldering iron as well (dammit!)

When I get my SGI (r5000 O2 with 20" monitor and AV card) all my problems
will be solved, but until then my Falcon will have to do (sigh!) ;^)

Kind regards,

Chris Wilkinson, Middle Earth, New Zealand.

313. SL2002 R3 some redraw problems under MagiC Mac

Newsgroup: comp.sys.atari.st
Date: 2002-06-13 15:13:14 UTC
From: Jo Vandeweghe <dipching@wanadoo.be>
Message-ID: <3D08B68A.3020406@wanadoo.be>
Source record: 34171

I just want to know if some people here have the same problem I have to share this to Ulf Dunkel.
I'm the happy owner of SL and made a lot of updates without having solved a strange minor problem.

When I load a new set of color (CFT file) the file is perfectly loaded, but at this time I always have the color dialog box which refuses to redraw completely ..... so it becomes complicated to quit this box to continue to work. I have to guess where the "OK" button stays ..... only the "Load" button is left and also the little color display window inside the dialog box ....

I only succeeded to avoid this problem with the german demo of SL2000 Light !!!!

Ulf is trying to find out from where the problem comes. He asked me to take snapshots of this ....
And this leads to the second problem I met :)
I have installed JML-Snap which don't work for me because he crashes MagiC Mac and even Mac OS .....
When I reboot and go back to MagiC I succeed to open some snaps in the root directory but they are unusable; some are completely black and some have horizontal strips of colors .....

If you have any experience about this problem I would be happy to receive your feedback.
Thanks in advance.

Yours Jo

I should say, use MiNT and you won't have any troubles.:-)
Calamus SL2002-R3 works just great here on my Hades running
FreeMiNT/N_AES.

Do you save the snap in (X)IMG format? Don't do that. Use IFF instead.
This is the best solution.

An Atari owner without a soldering iron? That's like a Jedi without a
light saber.....
Any phone jacks in the house? Option 937, dial up to the pc where ever
it's at and and zmodem the files you want (unless it's a long distance
call). Surely you have a modem laying around for the old bird.

Sorry to hear about the SGI.....:)

Steve Cohen (Wizztronics) once told me that he and Brad (Best
Electronics) obtained the source code for TOS 4.04 during the closure
of the Sunnyvale Atari offices. He also stated that they now own the
rights to TOS 4.04. This was direct from Steve, but who knows. I've
never seen proof of ownership, claimed or unclaimed from any recent
acquisition of the Atari name. Most silently ignore the fact that
Atari actually produced computers.
Before some begin to fire bullets at Wizztronics rep, for many years
they reliably supported the Atari market with fantastic products. The
cannon shot will likely come from those who want to know what happened
to the Barracuda 040 project. There are working prototypes of the card
in existence. I personally saw one at the Sacramento Atari show in the
back of Steve's rental car..Maybe not powered up, but real hardware
nonetheless. It was a money loosing project.
Steve is a business guy all the way through. Hell of a nice guy to of
had working in the Atari market. However, everyone has to eat. I don't
think that he would be receptive to "freely releasing" what ever it is
he has, so that point is null. What does he have planned for it? Who
knows. He will only talk if you have the cash.
My 2 cents
Mike

Just received the key for Eric Reboux' Find It program. Although the demoversion is already impressive and very well designed the use of a kay enhances a few other capacities of the program you don't want to miss. Just go to his site and try the demo or even pay the fee. The program deserves it!

It has the looks of how a program should look in our days.

I really recommend it and would like to ask you all to support the guy.

This should be strictly a "get-by" measure. The physical magnetic
media differs between HD and DD floppies. I've used HD disks with the
hole taped over, and they'll usually last one write and a couple of
reads.
There are several places on the net that sell new & used DSDD and SSDD
floppies.

ok, here I think you go a little far.
Linux is certainly not big, 8 meg is far from microsoft or Mac
requirements.

PS: do not confuse Linux kernel and the packages/services that it comes
with. Nothing to do with the OS itself.

Sorry I'm a bit late on this B^)

What version of Imagecopy are you using? It might be the 4.1CD version
that has options in OPTIONS\SCREEN\DISPLAY\VIDEO for various grahics
cards. Trial and error with the options here should sort you out.

Hi All:

I would just like to bring to your attention for those that do not know of a great resource we have:

The Atari-MIDI Archives!

http://groups.yahoo.com/group/atari-midi-archives/files/

The 2o+Megs are just about up,but I was amazed at all the great apps that members have been collecting there. Worth checking out!

We have a Sound Section which deals with Sounds and sysex utilities for specific synths. Most are grouped according to manufactuer.

We also have APPS, which also have a folder for sequencers and algo-comp apps. Nice stuff in there.

We also have a utility folder which has general stuff for Atari computers: Mouse acc's and serial mouse drivers, disc utilities and more.

Please make use of this resource! you never know what you might find!

With MagiC or MiNT you can access FAT32 partitions of any size.

> Sorry to hear about the SGI.......:)

I have got a soldering iron, just a broken one! :(

The PC and Atari are in the same house, just at opposite ends. A cable
would be a nuisance to others living here, and too slow for my liking.

Whadya mean sorry about the SGI?! It'll be the best thing I've ever
done. I can run STonX on it if that would please you but I'm sure
the SGI apps will keep me happy enough for a while! :)

Kind regards,

Chris Wilkinson, Middle Earth, New Zealand.
ATARI and (soon to be) SGI owner.

Hi Standa,

>> Well like usual I'm the odd one out.... I don't like QED, I prefer Luna
>> which IMO is far more advanced and has lots more features.
>
>Yes. I really like Luna too. But as long it takes ages for it to start I
>prefer to use QED as an editor.

Download a recent version... from http://www.rgfsoft.com .
Luna 2.xx starts up lightning fast, and it's a lot faster in loading files
as well, i.e: a 2MB file will be loaded & displayed at least twice as fast
as what QED can manage.
If you have lots of memory try loading a 50Mb file into QED and see for
yourself what happens, then load the same thing into Luna...

>Moreover it is open-source and I can implement what I need.

Well, then you better start implementing right away... there is an awfull
lot to implement in QED before it will even remotely come close to Luna.
And the gap is getting wider all the time, Richard Gordon Faika is a very
productive guy ;-)

>Maybe Luna will be open-source too sometime in the future...

Ever since this thread started you've dismissed almost anything mentioned
here on the basis that it's not open source...
It's not open-source software that made Atari great, and it's not open-
source that kept this platform going until this very day. Furthermore IMO
the future of this platform will come from closed-source, like it always
did, it's the quality of the software which will make the difference, so
far (except for MiNT) I haven't seen anything come from the open-source
corner that should make me change my mind.

Despite the fact that something is free and developed by a multitude of
dedicated people, doesn't affect me, the end-user. Like most people I'll
go for the best, if that means closed-source and having to pay for it, so
be it... I'm almost 100% certain that you don't understand this kind of
behaviour... but take my word for it, I'm not the odd one out regarding
this, most users feel and act the same way.

>The other thing is that it is in GFA. Which is not very comfortable IMO to
>develop in....

Here's the developer talking again.... me as the end-user don't really care
in what language the app is written, it works for me, so I couldn't care
less in what programming language it's created.

>> Suppose, you write an improvement for MiNT, but the maintainer(s) think
>>it's crap and refuse to implement it? what are your options?
>
>The same as using MagiC and trying to do the same. Actuall there are
>more bacause you can use your own version and spread it over people who
>like it.

But that's the last thing we need!!
If this would happen then it means that we'll be flooded with different
versions of the OS, which at a certain level are incompatible...

>This is just complete rubbish.... Yes, the rejections might happen. But
>if there are these rejections also in MagiC then you would be stucked
>the same way. And the rejections are there. You'll send an improvement
>and the other person would say it his idea and would get paid for that.
>I don't like closed-source commercial software for this. I don't want to
>judge Andreas here. These are just an examples.

Hm... let's assume I would have a brilliant idea and suggest it to Andreas,
he likes it and implements it... why do you assume that I need to be payed
for it? he's the one coding it, my reward would be that MagiC would have
one more feature added to the long features list, and its a feature which I
could use to my advantage, that's good enough as a reward...

>Not really. As I've said you have to do this only for apps that really
>supports all you need. But e.g. in the NVDI case there will be no more
>drivers AFAIK except a possible MagiCMacX ones. No native ARAnyM drivers
>etc. Why? Just because of the lack of time and no money effect IMO. :(

Why would the brothers Behne support ARAnym? from what I've been reading in
this thread so far, I had the impression that under ARAnym everything runs,
and now your telling me that NVDI needs native drivers?

>I know I can write the NVDI driver for it. But I did not jsut because I
>want to have free platform a I already have it. No copyrights, jsut
>(L)GPL. Many users just don't care, but I do because I work as a
>programmer and I really know the price for the sotfware.

Besides this being a very extremistic view you should realise that with
this attitude your hopes of everyone using ARANym, emuTOS etc...someday,
are practically reduced to zero...

>> Let's face it: fVDI is a nice app, but I still need NVDI to print
>
>Just not implemented yet.

Well Standa, as long as this isn't implemented I don't even consider giving
fVDI a second look. I'm not prepared to throw out all my apps that need
GDOS to print just for the sake of using something that is free.

>if you'll be interested you can design and programm a print driver for
>sure.

Even if I was capable of writing printerdrivers for fVDI, why would I? My printer works perfectly with NVDI... once again, if you want people to use the alternative, the programmers have to make sure that the alternative is just as good as the original...
Someone codes an according to some people much better app then NVDI, but then it turns out that the users have to write their own printer-drivers and other missing little bits and pieces.... are you serious?

>I don't want to bother to support a death NVDI. But
>nothing is going to stop you if you implement a native ARAnyM NVDI
>driver. Behne brothers gave quite a good feedback about how to do it,
>but I just don't want to. It would be happily accepted to the CVS if it
>works.

Well, as far as I'm concerned this is the end of a (quite) interesting thread, with the kind of attitude displayed above, the chances of ARAnym ever becoming a success are nil, don't blame us... you're the one killing your own baby.

Cheers from Belgium
Dennis

Sure, I was talking about the development and not about the users...

>>>Suppose, you write an improvement for MiNT, but the maintainer(s) think

Sure, but it is unlikely if you do a relly good thing that it is going to be rejected.

>>Not really. As I've said you have to do this only for apps that really
>>supports all you need. But e.g. in the NVDI case there will be no more

> this thread so far, I had the impression that under ARAnym everything runs,
> and now your telling me that NVDI needs native drivers?

Nope. I'm trying to tell you that it is better to have native driver for
the graphics. You can use ARAnyM with the NVDI original driver as well.
but it would not take the advantage of the host os graphics power.

> Besides this being a very extremistic view you should realise that with
> this attitude your hopes of everyone using ARANym, emuTOS etc...someday,
> are practically reduced to zero...

The hopes to force all use open-source platform are zero until the time
when it will have better features ;). Anyway just try to use ARAnyM on
its own. No open-source, no freeware nothing... just only a fast machine
on top of any hardware.

>>>Let's face it: fVDI is a nice app, but I still need NVDI to print
>>
>>Just not implemented yet.
>
> Well Standa, as long as this isn't implemented I don't even consider giving

> GDOS to print just for the sake of using something that is free.

Sure, you don't have to use it. It just me who is trying to finish it
and make it usable to others for several reasons: there is no other
choice for the future enhancements and because it is really good shaped
piece software AFAICS.

>>I don't want to bother to support a death NVDI. But
>>nothing is going to stop you if you implement a native ARAnyM NVDI
>>driver. Behne brothers gave quite a good feedback about how to do it,
>>but I just don't want to. It would be happily accepted to the CVS if it

> thread, with the kind of attitude displayed above, the chances of ARAnym
> ever becoming a success are nil, don't blame us... you're the one killing
> your own baby.

You don't understand what really ARAnyM is. As I've said I've mixed two
problems here: 1. What is ARAnyM for? and 2. What I think people should
do. The latter is _only_ my opinion which do _not_ stop anyone to use
ARAnyM. ARAnyM is not about NVDI, FreeMiNT, EmuTOS! You can use whatever
you want to use. It works pretty well. Please do not mix theses two
problems more.

best regards

Hi,

I recently got myself a second falcon, very cheap. (130 eur, tons of stuff uncluded)
It uncluded a 32mhz Mighty Sonic accellerator with fastram. However it is not fitted, and I have no fitting instructions. I recall something about 10 wires needed to be soldered to various circuts, and bending a couple of component legs.

Can anyone help me? Where should the wires go? What pins should be bent?

Regards

/Peter

>think.
>
>Thanks,
>Chris

The short story is that it's a method for publishing system extensions
to
a common area. If you have an Auto folder program like GDOS that a
programmer
can use, it publishes a cookie to the cookie jar stating it's existance.
The program
checks the cookie jar when it starts (usually) to find if features it wants
to have
available are available. If we find a GDOS cookie present with an
acceptable
value, then we know that certain routines are available for use in the
program.
The cookie jar also contains a pointer for the program to find routines or
functionality
provided by the auto folder program.

If we didn't have a cookie jar, then we would probably have several
different methods
of individual applications reporting their existance to programs that might
want to use
them.

You can think of it in a way like an old fashioned bulletin board. When
a program
is successfully ran from the auto folder it puts it's card on the bulletin
board with it's
name and address. When you want to use that auto program, you go to the
bulletin
board and see if it's card is there and if it is you get it's address.

I can understand that, but I thought that maybe for, let's say, propaganda reasons, it would be good to have an easy-to-launch setup even now. More people would be inclined to try it, and perhaps someone might come up with an worthy suggestion or an important bug report. I suppose that preparation of such a (linux or whatever) setup would not be very much entangled with the inner workings of the ARAnyM, so perhaps someone might be willing to join your team in order to make it, thus not interrupting the activities of others?

Hi Peter,
Download and get DoitF030 registered. There are several pictures of
the installation, and a copy of the installation instructions from my
setup.
Two of the pins on the CPU must be lifted, and one a wire soldered to.
This is EXTREAMLY difficult to do without the proper equipment. A
microscope, very thin soldering iron, and a very steady hand are
required. The other wires solder to the GALS in the front of the
board. You'll want to be sure to use the latest DMA buffer
modification as well or you'll have SCSI problems. Pretty sure most
everything is documented in the DoitF030 HTML manual.
Mike

I did this with a 40W soldering iron and a couple of cans of beer ;-) It's not really difficult, the trick is to wedge a very thin screwdriver behind the pin, heat up the pin until the solder melts and then lift it a couple of mm with the screwdriver. Repeat this with the second pin. IIRC the pins are at the corner of the CPU, so they're easy to access.

Then you'll have to solder wires to these pins, this can be a little more difficult. Wedge a small piece of paper between the pins and the PCB first, this prevents you from solder the pins to the PCB again.

Date: Wed, 12 Jun 2002 21:02:52 +0200

HI Ctirad,

>Oh god... Please, what do you mean by an "TOS compatible platform" ?

"TOS compatible platform" is hardware which contains TOS, all the user
has to do is to flick the ON switch and get cracking.

>is it a machine which can run unmodified ST TOS ? Sure not. Falcon, TT
>or Milan can`t run ST TOS, but they are sure the TOS (compatible)
>machines.

Now I'm the one having to ask what you mean.
Over the years I used quite a lot of different TOS versions, but I never
seen one labeled as ST-TOS. AFAIK, every TOS version carries the label
"ATARI-TOS".
And what on earth is an unmodified ST TOS? It can only be TOS 1.0, since
from version 1.02 onwards modifications were made...

>So the right definitions are:
>
>TOS compatible OS = an OS which can run *umodified* TOS applications.
>TOS compatible platform = a whatever machine + TOS compatible OS

I my book these two definitions are the same thing. I don't consider a
TT, Falcon, Hades, Milan etc... to be a "whatever machine".

>>That's exactly what an emulator does.
>
>No, it doesn`t. An emulator emulates a hardware, not an OS API.

MagiCMac doesn't emulate hardware....

>Also the TOS OS is still the true one if it runs on ST, TT, Falcon,
>Milan, xTOS, RISC workstation, x86 PC or some kind of newly developed
>PPC machine.

That's your perception...
The TOS inside a TT, Falcon, Milan and Hades has been modified so that it
can recognise new hardware which wasn't present in the ST. But that's it,
you'll need a lot more then just a "modified" TOS to ever see the Memory
test appearing on a xTOS, RISC, Mac, PPC or x86 PC.

BTW: xTOS is vapourware....

Cheers from Belgium
Dennis

>take snapshots of this ....
>And this leads to the second problem I met :)
>I have installed JML-Snap which don't work for me because he crashes
>MagiC Mac and even Mac OS .....

Use IMAGECOPY instead, this app works without any problems under MagiCMac.

>When I reboot and go back to MagiC I succeed to open some snaps in the
>root directory but they are unusable; some are completely black and some
>have horizontal strips of colors .....

With Imagecopy I usally make the screenshots in GIF or JPEG, never had a
problem so far...

>If you have any experience about this problem I would be happy to
>receive your feedback.

I never experienced anything like this with Calamus, I managed to crash
MagicMac many times, but it never took down the Mac OS. No problems either
with the CFT files in Calamus 98, 99, 2000 and 2002 light....
I suppose something in your setup doesn't agree with Calamus...
In my experience MagiCMac works a lot better when the Mac OS virtual memory
is turned off, also make sure that the virtual memory setting in Calamus is
off.... that's about all I can offer to help.

PS: There's a mail to you on it's way :-)

Cheers from Belgium
Dennis

Or find them at car boot/yard sales! Look for disk boxes full of disks;
doesn't matter what computer they were for, you can always reformat
them. Just don't use any with damaged flaps.

I have a PARCP cable, but I think it would be too slow for the
large downloads I have in mind - also I am not sure how to handle
it at the PC end. Since I have a spare EZ135, my solution should
be easier/quicker. I have now purchased an Adaptec USBXchange but
haven't installed the driver or tried it out yet. One problem is
that there is no driver for XP, only 98 and 2000. May have to try
their support pages to see if there is an update downloadable.

Dobry den!

/Peter/

>connection worth thinking about maybe.

Hi Derryck!

As I said in another reply about PARCP, this also may be too slow
and I don't know how to set up the PC side. The printer is shared
now - I have a switchbox so that either computer can connect to
either of my 2 printers - the 24-pin NEC and the Deskjet. In fact
they are cross-connected - when my Atari is switched to the
Deskjet the PC is connected to the NEC, and vice versa.

A shared internet connection is worth thinking about, but not sure
it offers much advantage. I might as well use the PC for browsing
(quicker, easier) and transfer any files I need to the Atari
- hopefully with the new Adaptec USBXchange.

Regards, /Peter/

:)
If you can resolve visually the size of the pins, then it isn't to
hard. You forget to mention that you don't get to many chances moving
the pins around before the simply break off :)
He said he was a new Falcon owner, and didn't want to throw caution in
the wind concering the Mighty Sonic/Afterburner installation. Would
like to keep him and his Falcon around for a while maybe:)

Since MagiCMac for OSX it does. Even the old MagiCMac (PPC compatible)
relied on a processor emulation although it was not built inside
MagiCMac.

> >Also the TOS OS is still the true one if it runs on ST, TT, Falcon,
> >Milan, xTOS, RISC workstation, x86 PC or some kind of newly developed

The TOS was heavily modified to run on Milan, Hades and some 030
cards. And the CF4e has certainly more in common with the 68k than
with PPC & x86.

>
> BTW: xTOS is vapourware....

Everything is vapourware until it's released.

Hi,

> Download and get DoitF030 registered. There are several pictures of
> the installation, and a copy of the installation instructions from my
> setup.

I've used these archives before, great stuff. I must download the latest
version. The version I have here only features one picture of the
MightySonic32.
Is there any difference between MightySonic32 and MightySonic? Or are they
the same thing? My german is not very good, I used to study female anatomy
instead of going to german class...

Cheers

/Peter

> like to keep him and his Falcon around for a while maybe:)

Actually, It's my second falcon. I've got one with a CT2 which I fitted myself. I used to work with SMD prototyping with components a lot smaller than the ones in the falcon, so it should be no problem really.

However, I did a lot of hacks on my other falcon before I knew how. I am not sure how it survived really. I must have short circuted just about everything twice, but the only thing not working properly is the right soundchannel (not a problem as I use an external output expander)

On the CT2, I had to remove the CPU to make it stable. I know this problem is very rare. Does anyone know if this may be required on the Mighty too?

Cheers

/Peter

Hi

>I have no problems about the size of the PS, considering I want to mount the
>1040 in a 2U Rack.

I think you may need a low height PSU. A normal AT power supply
had to be trimmed to fit into my rack, and that was a 3U! Guess
it depends on the depth of your rack too, as my PSU is sitting
above the ST motherboard inside, just above the RAM in an STFM.
Where the old one used to sit, but mounted on the rear panal.

Hi

Anyone have instructions on setting it up, have the disk kicking about somewhere? I downloaded what I hoped was the right software but if I run it from the floppy disk (TOS 1.04 STFM) it says AT Speed night vorhandan which sounds like it can't find it if my translation was right. Any ideas? Maybe the AT Speed is just dead.

The Portfolio is a MS-DOS compatible PC with an Intel 8088 processor.
I suppose any C compiler for this setup will work.

You develop and test on a desktop IBM PC computer and when finished
transfer it to the Portfolio.

ST-TOS, ATARI-TOS, whats the difference? thats only pointing words.

As a unmodified TOS we should consider any TOS version for any machine that
does not need patching to run. All clones uses patched versions of original
TOS. Patches are usually for 040 and 060 support (no original version of TOS
will work on this processors IIRC)

> MagiCMac doesn't emulate hardware....

Yes it does. Harddisk images is emulation of harddisk. ANd, there is (lousy)
YM chip emulation.

If you are developing any program that you want to create new cookie plese
try not to, especially if you want to pass any pointers to your program
memoryspace through cookies.

Please, avoid using cookie for anything other that passing information that
your program "exists" in memory (if possible).

If you do this your Falcon will probably not work... The Mighty Sonic is
very similar to the Afterburner, and atleast my Afterburner has been very
stable since I removed the Nemesis card. I don't think you need to apply
any other patches than perhaps a better DMA patch.

>>If you can organise an Ethernet adaptor for your Falcon

>As I said in another reply about PARCP, this also may be too slow

It's quite fast, and even if it isn't as fast as the sneakernet solution
you're suggesting, you can leave file transfer going on in the background
(at least, using Vassilis' Magxnet drivers, don't know about the StiK ones).

>and I don't know how to set up the PC side. The printer is shared

It wasn't hard :-)

>now - I have a switchbox so that either computer can connect to
>either of my 2 printers - the 24-pin NEC and the Deskjet. In fact

The big advantage of printer sharing is that you can use ANY printer. You
aren't locked into what is now legacy technology. The Epson Photo 895 I have
now is USB only, but I can print to it via my laptop from a printed-to-disk
file from my Falcon, although I can't work out how the various printing
options from NVDI interact with the similar options from the printer control
panel on the laptop. Any camera memory cards plugged into the printer become
drives to the laptop, and can thus be made shares and also available to the
Falcon. In fact, the only problem is that one has to use a command line
interface, AFAIK Vassilis is still working on integration of Samba into the
desktop.

For day-to-day use I still have my Kyocera laser hooked up to the Falcon :-)

>A shared internet connection is worth thinking about, but not sure
>it offers much advantage. I might as well use the PC for browsing

Yes, agreed. But then you could download files for your Falcon to it via
your shared connection which would negate the need for any other gear.

>- hopefully with the new Adaptec USBXchange.

It's always possible that XP might already have a driver for this kit - have
you plugged it in?

Cheers

371. How to format ST disk on Linux?

Newsgroup: comp.sys.atari.st
Date: 2002-06-16 12:55:47 UTC
From: Jacek Popławski <jp@no.more.hosts>
Message-ID: <slrnagp30j.j9.jp@localhost.localdomain>
Source record: 34126

Hello.
I bought Atari 1040 STfm yesterday. I never used this computer, but when
I had only Atari 800XL - ST was something "big, new and powerfull". So I want
to try use it today.
I have only one disk with operating system. I downloaded few games for
emulators, for example I have:

Rick Dangerous 2.msa

How can I run this game on Atari?

How can I create ST disk on PC with Linux? Should I format standard DOS disk?
What about 720KB (I have only 1.44MB disks) ?

Where can I read about it?

372. CT60 NEWS

Newsgroup: comp.sys.atari.st
Date: 2002-06-16 13:12:07 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3d0c8ea3$0$468$626a54ce@news.free.fr>
Source record: 34127

Hello,

I will get the CT60 with the corrections, next week end...

Last Friday I found a big bug on the SDRAM chip.
It is corrected and I will verify this this evening at 23:30 !.

I know that some people are now thinking that the time to deliver the CT60
is very long, but I spend a very short time on the CT60 because of my job
and my travels between France and Switzerland...Hopefully I get a PC
notebook to work in the TGV.

During this evening (in the TGV) and the week I will finish the CT60
External arbiter : the one that allows the falcon bus arbitration between
motherboard (Blitter/SDMA) and CT60.
The internal arbiter that arbitrates between 060 and CT60 slot is finished..

It still a bug on some DSP accesses, but we will work on it when Didier
Mequigon and Xavier Joubert will get their CT60, because the cause of the
bug (hard or soft or both) is not identified... Maybe the following week.

And as soon this last problem is solved, I start shipping CT60 to you !

I did some nice pictures 3 weeks ago of the new CT60, but no time to modify
the web site : I will install the pictures next week end !
It will allow you to positively wait for your CT60 ;-)

Regards

http://home.tu-clausthal.de/~ifmar/makedisk/ for a tutorial.

Sorry, DOS or Windows only. Plain 720k .ST files could be written with the
dd command as well. There are currently no known tools for transfering other
disk images back to disk under Linux.

It does not use disk images here. If you create a folder or whatever under magicmac it appears on the mac desktop as well.

It is on the "to-do" list :-)
But since Luna 2.09 is still a beta, it's not really the right moment yet,
once that Luna is out of the beta stage.... we'll tackle it.
In the meantime you can download Luna 1.54 from the RGF website, that par-
ticular version was completely translated by Peter West, English RSC and
HYP file....

Cheers from Belgium

As long as you use makedisk, you don not need an convert.
Makedisk handles *.MSA files as well.

http://pageperso.aol.fr/zorg63/index.html is a converter tool for Windows
for the case that you really want to convert *.MSA files.

MSA is from magic shadow archiver, its original version ran on the atari st
itself for compressign entire floppies. The others you might find are for
emulators. I'm not to familiar with the emulator formats themselves since I've
got several real systems around.

Hi Peter,
The Mighty Sonic is much easier to install than the CT2. If you've
removed the CPU on that installation, you should have no problem
installing the Mighty Sonic. You won't have to remove the CPU for the
M/S installation, it's pretty straight forward. I run mine at 40 Mhz
in combo with a Nemisis. 40 Mhz seems to be the limit. It will run at
42Mhz, but SCSI flat out won't work above 40 Mhz, much like the
Afterburner. Mine also has a NOVA ATI installed which takes some load
off the bus. Running Videl graphics in high color modes will cause DMA
problems at 40Mhz on my installation. If you go to use the expansion
pins, you'll have to bring a few of them through the connector as the
trace layout was missed during manufacturing. An Ohm meter will point
those out. The Mighty is very reliable and compatible. Cubase will
run, but not from alternate ram. My Mighty was installed back in 1993
and my eyesight was much better then:) At 46, even with glasses, I
find a large magnifier necessary, especially if ale is on the table
during the installation:) Check out DoItF030.

Mike

Try the one for W2K, that should be OK, you may have troubles if its aint
WHQL, but just override the installation whinge box.

I agree completely.

> >is it a machine which can run unmodified ST TOS ? Sure not. Falcon, TT
> >or Milan can`t run ST TOS, but they are sure the TOS (compatible)
> >machines.
>
> Now I'm the one having to ask what you mean.
> Over the years I used quite a lot of different TOS versions, but I never
> seen one labeled as ST-TOS. AFAIK, every TOS version carries the label
> "ATARI-TOS".

I mean TOS from an Atari ST (1.xx).

> And what on earth is an unmodified ST TOS? It can only be TOS 1.0, since
> from version 1.02 onwards modifications were made...

Exactly ! So we can not speak about a TOS uncompatible (or TOS compatible)
hardware (or platform if you want), because any machine can be a TOS clone
when you modify TOS for it.

> >TOS compatible OS = an OS which can run *umodified* TOS applications.
> >TOS compatible platform = a whatever machine + TOS compatible OS
>
> I my book these two definitions are the same thing. I don't consider a
> TT, Falcon, Hades, Milan etc... to be a "whatever machine".

As said, it is a TOS what makes the TOS machine, not the hardware.

> >>That's exactly what an emulator does.
> >
> >No, it doesn`t. An emulator emulates a hardware, not an OS API.
>
> MagiCMac doesn't emulate hardware....

I m not sure about that. You told that MagicMAC can run any original TOS, so
there must
be some kind of hardware emulation. However, MagiCMAC/PC is much more than
just
an ST emulator.

> The TOS inside a TT, Falcon, Milan and Hades has been modified so that it
> can recognise new hardware which wasn't present in the ST.
> But that's it, you'll need a lot more then just a "modified" TOS to ever
see the Memory
> test appearing on a xTOS, RISC, Mac, PPC or x86 PC.

Well, I can't see any difference between modifying TOS for, say, Milan, 68k MAC or Amiga. On a non 68k machines you will need only to add an 68k emulation and that's all.

Well, Linux needs no to be binary compatible, because "all" software is
distributed in source code, so any built-in CPU emulation would be only a
wasting of time and CPU power.

That's true for Hades, AB040 or Centurbo. Milan has a really new TOS, AFAIK.

> Patches are usually for 040 and 060 support

There are a lot more changes, at least in Milan TOS.

Since you are insisting on the "all" fact, I will have to STRONGLY
disagree.
A *BUNCH* of applications are not distributed with src as they are
commercial.

IBM db2 for example.
Oracle.
Homepage builder.
Maya.
Softimage
...
etc...

Hi!

Is there any other mechanism to let the other application read my data?
I know this approach breaks the memory protection rules. But what should
one use e.g. to publish an interface?
Maybe a use of an SLB would be a solution. But how the SLB should check
whether the feature it needs is present or not?

best regards

STan

If your program is some kind of library that adds aditional funcionality,
then the best way is SLB. But if your program is TSR the you should use
shared memory (avialible in MiNT and MagiC). Keep in mind that if two
processes share memory region they can see it under diffrent adresses so
passing pointers is not acceptable.
YOu can also use pipes (and I think this is a best solution for TSR).

Just checked the current version of DoItF030, and the connection
details are supplied. You must have a very old version, sent that info
to Robert years ago:)
The M/S 32 has fast ram, the Mighty Sonic does not, it's just the CPU
on an expansion card. The connections are different between the two.

For MiNTnet there is Sharity Light, which mounts SMB-shares under the
/nfs-directory. Perhaps it's possible to compile it for MagiCnet as well.

401. AWeb source released

Newsgroup: comp.sys.atari.st
Date: 2002-06-17 23:31:27 UTC
From: Iggy Drougge <optimus@canit.se>
Message-ID: <1118.934T1350T314855optimus@canit.se>
Source record: 34057

This is not perfectly Atari-related, but it could be of interest to ST browser coders and coders in spe.
The source for the Amiga WWW browser AWeb has been released to the public, and it's quite a competent browser (definitely more so than CAB, IMHO), including Javascript support (though far from perfect). The code has already been cleaned up to compile with GCC (originally written for SAS/Aztec C) in just a week.
Of course, porting it to the ST is far from straight-forward, but it's nowhere near as bestial as Mozilla, and the programmer could perhaps concentrate on porting the GUI, whereas the renderer could be kept somewhat intact.
The official repository is at http://aweb.sunsite.dk/ .

Unfortunately not. Currently it forces you to enter the hugely complex
expression "shlight //smbhost/smbshare /nfs/local-name" at the command
line or in some script.

> if not, forget about it, you gonna get burned by magic enthusiasts.

Usually I probably would, but in this case "their" tool is more complex
and less userfriendly than "ours" ;-)

I do not think it will work under MagiC becouse Sharity Light works with NFS
filesystem which is missing in MagiC.

I may make as mistake but the Mighty Sonic 32 and Mighty Sonic is the same product. The acceleration card you mention is called Eagle Sonic (32). See http://x-com.atari.org (-> Gallery -> Falcon030), you'll find both the cards.

Sharity light strictly require the nfs.xfs. So you have to port first the
nfs filesystem driver to MagiC.

412. Re: STF & SCSI 100Mb Zip Drive

Newsgroup: comp.sys.atari.st
Date: 2002-06-18 10:44:28 UTC
From: Rob <rob.jenkins2@btopenworld.com>
Message-ID: <kp1ugus6ee82okq7s0eb2nsghns1hjlg1n@4ax.com>
Source record: 34069

Hi Andrew, I'm in the same boat as you, I have a 520ste which I'd like
to use my scsi zip100 with as an hard drive. (seeing as I already have
one, and to save going and buying a hard drive for the atari.)

From the little I have discovered, we do need adapters, called LINK2.
I don't know where we get them from, if you find out, can you let me
know.(Are you based in the uk at all)

Anyway, I'll copy & paste everything I have collected so far.
Check out the notator user group for more advice

Rob.

A discussion has come up in the Notator mailing list (see my
signature)
regarding backing up data in a safe and simple way, and someone
mentioned using zip drives.
Actually using a zip drive instead of a harddisk because of the much
lower noise level (which is important for us musicians).
(then using a harddisk to back up the data from that drive!).

I could use some information on how to set up a zip drive with an ST
as
I've never used one myself.

Obviously one needs the SCSI version and an SCSI adaptor. Will any
host
adaptor work? Does it need to support parity?
How about software? I understand that HDdriver supports Zip drives:
from
which version (in case someone gets a second hand offer)?

There's also some talk about connecting a wire to a pin of the
joystick
for power. I take it this is the +5V signal needed for SCSI "TERMPRW"
at
some pin of the SCSI unit (pin 11?).

Anything else to remember? When everything is set up, will it then act
just like any harddisk?
Will such a drive be auto-bootable? Someone who has a zip drive
connected to his ST tells me that he needs to reboot it after power
has
switched on (warm boot), and some AUTO folder program has to be used.
Sounds cumbersome.

Hallvard

Hi Hallvard

>I could use some information on how to set up a zip drive with an ST as
>I've never used one myself.

Open the box, extract the contents, plug into your SCSI chain, switch
the device ID on in HD-driver, reboot, use.

>Obviously one needs the SCSI version and an SCSI adaptor. Will any host
>adaptor work?

Yep.

>Does it need to support parity?

It isnt bothered i dont think, mines been lugged into a few systems
with
no troubles.

>How about software? I understand that HDdriver supports Zip drives:
>from which version (in case someone gets a second hand offer)?

All i beleive

>There's also some talk about connecting a wire to a pin of the joystick
>for power.

New ZIP's i understand provide TRMPWR, but a diode to the relevant pin
from a +5V line in the zip will suffice, but if youve other devices on
the SCSI chain use one of them to provide power.

>I take it this is the +5V signal needed for SCSI "TERMPRW" at some pin
>of the SCSI unit (pin 11?).

i thought it was 25,

I also have a USB ZIP on't PC, so its really usefull to be able to
drag
stuff from the Atari for CD backing up or to the Atari following a
fast

web download.

You just need to make sure that HDDRiver is configured for windows
partitions and that the ZIP disks are partitioned to suit TOS and DOS

As far as I know it does. The best host adapter (highest compatibility
with SCSI) is the LINK96 or LINK97 by WB Systemtechnik.

> How about software? I understand that HDdriver supports Zip drives: from
> which version (in case someone gets a second hand offer)?

7.00 or newer supports special functions for the ZIP. If you get a
second hand driver be careful that you get it on the original floppy
disk and that you get a written statement from the owner that he has
destroyed any copy. Otherwise your copy would be illegal.
BTW, the current version is HDDRIVER 8, with the demo version
available
on http://www.seimet.de/atari_english.html. With an English manual
it's
available from Atari Workshop.

> Will such a drive be auto-bootable? Someone who has a zip drive

> Sounds cumbersome.

Yes, any drive with removable media is auto-bootable. The ZIP is
nothing
special in most respects. The only thing that is different between the
ZIP and other drives are the built-in auto-spin down and password
protection functions.

Are these still for sale? Can they be bought from WB systemtechnik
directly? Are they a reputable firm? (There have been several scams
with
Atari dealers/suppliers, among others ICD, so I don't want to
recommend
a "shady" dealer to anyone, where they risk loosing their money).

[snip....]

Excellent information!
Do you mind if I forward your posting to my Notator mailing list where
people have asked about this?

By the way, what about that wire they talk about which goes from the
joystick port? I suppose this is a +5V signal which connects to the
"TERMPWR" pin of the SCSI bus. Doesn't sound like a very elegant
solution though -perhaps the abovementioned SCSI adaptors have this
already wired internally so an extra wire isn't needed?

> already wired internally so an extra wire isn't needed?

Below is straight from the ICD documentation, though I did not do it
this
way. One way I got around this is by having an external SCSI case
(with
nothing in it) and connect a wire from the +5V power supply to the
corresponding internal pin (which connects to pin 25 on the Male
DB-25P
through some cabling). The connector in the SCSI case is a 50pin
header,
which in turn connects to a 50pin centronics connector, which I
connect to a
centronics-to-25pin-SCSI cable then to the zip drive. I believe the
pin I
jumper was somewhere near the middle of the 50pin internal connector.

That was the first way I got this to work. Now I have a SCSI CDROM
occupying that external SCSI case. It powers the TERMPWR pin. So, if
you
have a SCSI CDROM drive, connect it to your atari first, then connect
the
zip drive to it and the zip drive will work fine once all termination
is
done correctly.

___BEGIN ICD DOC___
How to get power for your Zip drive:

Make a cable that goes from your unused joystick port to the unused
port on the back of the Zip drive as follows:

Female DB-9S pin 7 <------------> pin 25 Male DB-25P (5 volts)
pin 8 <------------> pin 24 (ground)

>(then using a harddisk to back up the data from that drive!).
Have you considered using a cd-writer instead of a zip drive? backing
up
files on CD-R or CD-RW has several advantages. The price of the media
is
only a fraction of a zip cartridge, a CD can hold up to 700MB of data,
the
writer can also be used by the musicians to burn their latest
projects,
CD's are platform interchangable (any CD-R can read the CD).

>I could use some information on how to set up a zip drive with an ST as
>I've never used one myself.
Dr.Uwe Seimet has answered this already :-)
Setting up a cd-writer is very easy, you'll need the LINK and a
dedicated
software package, for musicians I recommend SoundPools CD Recorder
Pro...

Cheers from Belgium

I'm trying to find more information about the "Link 96" and "Link 97"
SCSI host adaptors, and if they're still available.

Apparently, WB systemtechnik in Germany were responsible for them.
I had a link a while ago which listed them (as well as other Atari
items):

http://members.aol.com/wbsystem/aus_e.html

But the links from there, providing more information were broken.

Then I found out that they had set up a new site with their own domain
name:

http://www.wbsystemtechnik.de/

There was however absolutely no information there about any Atari ST
products. I've mailed them to ask about this, but though I'd ask here
as
well, if someone knows if they still sell them, or if someone else
does?

Hello,

I recently (within the last year)
wired a Link 97 intern in an External Case with SCSI drive.
Dr. Seimet and Newsgroup helped me configure HDdriver.

It works very well.

He also sent a nice catalog (Atari) with the order.

Thanks, but no need now as the website which I've been informed of in
this thread gives me what I need.
I also got en email reply from Norbert Wieczorek at WB Systemtechnik
where he verifies that they still sell the SCSI host adaptors.

Note that you only need to do this if you are not using another SCSI
device. If you use another device in the chain then the drive will
work
without term power from the joystick port. Also note that this is only
on
the Zip 100 units, the later Zip 250 units didn't have this problem.

>Anything else to remember? When everything is set up, will it then act
>just like any harddisk?

Mostly, you will notice that it is a lot slower than a regular fixed
hard
drive. It also has a auto spin down feature which after it spins back
up
brings in a pause of about a second before accessing data.

>Will such a drive be auto-bootable? Someone who has a zip drive
>connected to his ST tells me that he needs to reboot it after power has
>switched on (warm boot), and some AUTO folder program has to be used.

Thats never happened with my Zip 100, on both my STs and now my
Falcon.
It's possible it's a problem when used to boot from but I seem to
recall
it booting fine.

Cheers!

James

I take it you're using HDdriver with it?

You can can configure the time until spin down, can switch this
feature
off by software and/or can use other software to control the time in
case the drive spinning down on its own is not desired.

I also want to connect a scsi ZIP to an Atari 1040STf.
I have a scsi ICD adapter w/ software version 5.6.1
My adapter sees the ZIP scsi ID#5 on boot up and
can format the ZIP using ICDFRMT. However, every time I try
to partition it, it gets errors and says to reformat the ZIP.
I tried downloading and using the HD Driver Demo, but
it can't recognize the media on my primary scsi drive and says
the media is corrupt and won't let me even get to the process of
formatting the SCSI drive.

Question#1-Will the full version of HD Driver work with my scsi ICD
adapter, or do I have to buy a Link adapter?

Question#2-Will HD Driver with ICD adapter let me format the ZIP
so it is compatible with IBM and Atari?

Question#3-Is there a later version of ICD drivers that would solve my
problem?
If so, what is the latest version and where might I get it? (Mine is
5.6.1)

Question#4-ANyone know of a list of Manufacturers of Atari compatible
scsi II drives? (I just bought an IBM 2.1 Gig scsi II fast-wide that
won't be recognized by my ICD adapter)

Question#5-Is it possible to disable parity checking with the ICD
drivers
through software?

Thanks
Matthew Walter

If the media is recognzized to be corrupt note that the full version
of
HDDRIVER will also say so. Typically this is a cable or termination
problem. Whatever it is, it is most likely a hardware problem.
You cannot format with the demo version because the demo is
restricted.
Please refer to the README for more information.

> Question#1-Will the full version of HD Driver work with my scsi ICD
> adapter, or do I have to buy a Link adapter?

It will work without restrictions.

> Question#2-Will HD Driver with ICD adapter let me format the ZIP
> so it is compatible with IBM and Atari?

Not format, but partition. Formatting is irrelevant, partitioning is
what makes the difference.

> Question#3-Is there a later version of ICD drivers that would solve
> my problem?

No, There is no driver except HDDRIVER that supports partitions that
are
both PC and Atari compatible.

> Question#4-ANyone know of a list of Manufacturers of Atari compatible
> scsi II drives? (I just bought an IBM 2.1 Gig scsi II fast-wide that
> won't be recognized by my ICD adapter)

Any SCSI-II or SCSI-III drive can be connected to the Atari. Note,
however, that you need an adapter (16 to 8 bit) if you want to connect
one of the current UW/160 drives that have an 16 bit SCSI bus. This
adapter is nothing specific to the Atari. Also note that some drives
may
require initiator identification and thus require a LINK96 adapter.
But
as far as I know this is only required for some Quantum drives.

> Question#5-Is it possible to disable parity checking with the ICD drivers
> through software?

No. The only drives where you can switch parity off by software are
Quantum drives. You need special software for doing this, which is
included in HDDRIVER. But even with these drives and the right
software
you have to connect your drive to an Atari that supports parity in
order
to reconfigure the drive. With a host adapter not supporting parity
you
cannot do this because the precondition for the drive to be accessible
with this adapter is that parity is already switched off.

Hello,
I have an Atari 1040STf with an ICD scsi adapter and
the ICD software version 5.6.1
I have added an Iomega Zip 100 scsi to it and want
to be able to read the Zip on a PC and on the Atari.
My version of the ICD software doesn't give me the option
of formatting or partitioning for IBM compatability.

Also, after formatting with my ICD software,
when I tried to partition the Zip drive using ICD software,
I got this ERROR MESSAGE:
Drive timeout encountered while attempting to verify
drive: Sense code:$FF

Do you know what software and version I need to fromat
a SCSI ZIP drive to be read on both IBM and Atari?
Any suggestions?

Thankyou
Matthew Walter

Gett HDDriver. It supports the Zip and Jaz drive & does a very good
job
at time. Works well for me when I use my Jaz drive.

Matthew as a STF, I thought that HDD can only create dual compatible
ZIP's
with TOS 1.4 or greater , hence a no no for STF users.

The TOS version doesn't matter. HDDRIVER can create dual compatible
media with any version of TOS. The only difference with respect to the
TOS version is that with TOS < 1.04 the maximum partition size is 256
MB. But this is a limit of TOS, which has nothing to do with HDDRIVER
and applies to any partition, dual compatible or not.

Hello to everyone,
I have a 1040 ST and a 1040 STE, both with power supply burn. I gave both them to a friend to try repairing them, but, while waiting for an answer.... As far as you know, isn't possible to use a common PC power supply with my 1040? The voltage seem to be the same, 5 and 12 v., with some grounds...
I have no problems about the size of the PS, considering I want to mount the 1040 in a 2U Rack.
Any idea about this?

Thank you
Fabrizio

Assuming the 1040ST's power supply is the same or similar enough to the Falcon's, I had a power supply go bad on my Falcon and replaced it with a PC one. The issue you *MUST* be careful of is polarity of the wires. On the Falcon PS, the 12v Blue wire wasn't the same polarity as the PC's 12v Blue wire. It was the same as the 12v Yellow wire on the PC PS. I mistakenly connected blue to blue and blew a transistor in my Falcon's audio system. It was an easy enough fix, so I was luck that's all it did. It was quite spectacular, actually. I plugged it in, turned it on, and everything seemed ok for a few seconds, then a bright flash and loud pop exploded off my Falcon's motherboard and I heard half the transistor hit the wall on the opposite side of the room quite forcefully! So anyway, make sure to check the polarity as well as the voltage very carefully before making the connection. Otherwise, it should work fine.

>to be rejected.

That is by all means no necessity. The real beneficiaries (sp?) of open source are coders, not end users. The ones interested in free source code are mainly programmers, and the eventual end-user interest consists mainly of fringe benefits.
The problem with open source development in general is that everyone in charge is a programmer, people who have an immense computer knowledge, knowledge of the internals of the system, and people who regard the system as their "baby". Since they have been involved since the start, or, due to their involvement, have all but absorbed the entire "ideology" of the system, they don't regard changing the system as a priority, especially since they already know all its little quirks and like it the way it is, and also since they are the ones who'd have to do the work.
Non-programming end-users have different preferences than programmers, and commercial apps can't be choosy about their users, or development will cease due to lack of funds. Look at UNIX for a perfect example of this. Made by programmers, for programmers. Few non-programming end-users like the cryptic UNIX system. Programmers love it.
As a matter of consequence, suggestion which might appeal to a lot of end-users will not appeal to the programmers who make up the ruling class of the open source project. Wouldn't this go very far in explaining why UNIX remains cryptic and conservative, or why there hasn't been a ready-to-install MiNT version in years? Making MiNT easy to use and install isn't a priority to those who are already using and directing the MiNT project. Likewise, those who have made easier Linux distributions are mainly commercial enterprises.
Why do you think non-technical users are preferring MagiC? On technical merits? On ideological grounds? Wrong. It's an order of magnitude friendlier than MiNT, at least up to the point when you'd like to make amendments to the kernel. ;-)

>Nope. I'm trying to tell you that it is better to have native driver for

By all means, but try to convince someone with a printer with that kind of
argument. It's like arguing about the merits of the OpenBSD kernel to a
Windows 2000 user.

The only way in which ARAnyM would help in this regard is enabling you to
multi-boot into Windows, Linux or any other OS with a Netscape or Mozilla
port.

>Hmm, we don't want to use another OS. I just want to have my

This would have been a really good post if it wasn't rubbish.

On 18 Jun 2002, Iggy Drougge wrote:

> That is by all means no necessity. The real beneficiaries (sp?) of open source
> are coders, not end users. The ones interested in free source code are mainly
> programmers, and the eventual end-user interest consists mainly of fringe
> benefits.

Users use programs written by programers, it's that simple, it always has
been like that.
If the coders are happy with some libs, some GPL code, some IDE whatever.
The users will definitely appreciate that, as they will see a difference.

Simple example:

Game console: developers for PS2 when it came out just hated the thing,
really hard to code for it, crappy DK and all, results? few games, and low
quality games. It takes a long curve to know the tricks of the internals
and better tools to take advantage of the machine. Result? games are
better now, the users in some way ought to appreciate this whole deal.
Cg (for example) coming up soon by nvidia and microsoft probably don't
mean anything to you as it is too technical for the simple user, but it
will change a few things around, for the better of the users.

> open source project. Wouldn't this go very far in explaining why UNIX remains
> cryptic and conservative, or why there hasn't been a ready-to-install MiNT
> version in years?

Programers are users before anything, they are the ones using the machine
much more than average joe who just:
turn comp ON
click mail.yahoo.com icon on desktop.
login and send email.
turn comp. off.

That's your average Joe.
Average Joe who uses his computer once a week does not even care about cut
and paste keyboard shortcuts, no big deal, "I'll just type it, I'll never
remember it by next week". Programers definitely do care about that

kind of things.

Command line completion in shells. How long did it take for DOS to have
this simple feature? Well, no one care, coz no one really uses DOS
command line anyway.

The average Joe basically has no needs and couldn't care less about OS,
disk and all.
Does that mean that the OS, disk etc are not important? of course not.
Just uninmportant to average Joe. As bad as Microsoft publicity would like
to make us believe that Joe needs a P4 2.2 Ghz to browse the internet
faster and record video to send to friends and family. When average joe
still has the 12:00 clock on his VCR blinking as he can't figure out how
to set it.

Second point:
You don't change a winning team.
If it ain't broke, don't fix it.
Unix has been working for 30 years, been proven in the industry to this
day. Still in use, still selling very well, hardware, OS and services.
Same thing with AS400 and mainframes, as old and outdated as they may
seem, they just work.

> Making MiNT easy to use and install isn't a priority to
> those who are already using and directing the MiNT project. Likewise, those
> who have made easier Linux distributions are mainly commercial enterprises.

trying to make a buck.
What's wrong with that?
Who'll be making a buck on making a distribution on MiNT (based on open
src OS)?
MagiC being 100% commercial can't do it, what makes you think it would
work for MiNT?
All that for what? some people bitching that they can't run it
anyway on their 520ST.

> Why do you think non-technical users are preferring MagiC? On technical
> merits? On ideological grounds? Wrong. It's an order of magnitude friendlier
> than MiNT, at least up to the point when you'd like to make amendments to the
> kernel. ;-)

hmm wrong.
They prefer magic because:
1) magic is commercial and has had advertisement (I myself was fooled
years ago when I bought it), I truely believed the ads until I tried for
real.
2) because people don't have any needs, so anything will do. Magic or
singleTOS 1.0 will perfectly do for them as they don't have any
particular requirements.
3) because the hardware requirement can be met very easily with magic.
(example: I have an old Pentium one 75Mhz, with 24meg of ram, and windows
95 is installed on that, does that mean that windows 95 rules?)

Providing you make doubly sure of which wire is which polarity what voltage in comparison to your ST then that is a highly recommended upgrade. It'll give you plenty of scope for hanging loads of memory and assorted add-on's.

Are you acting like this on purpose?

You say Linux is bloated and is bigger and bigger everytime.
To which I replied that it is as big as you need it to be. The kernel size
is irrelevant as it is tiny. The distribution gets bigger coz you get more
packages, more software. That does not mean you need to install them all.
Just means they are there if you want to use them.
Why not ship ldap? smtp etc, doesn't hurt. Just more conveniant if you
want to use them and already there on CD, so you don't need to download
them from the net.
If magic came with papyrus, da's layout, papillon, Jinnee, emailer,
Pascal and Aniplayer, would you say that magic is bloated? I don't think
so. Just nice bundle I say :)

Actually, that isn't that unusual. Many 386 and 486 computers run in
people's homes as printservers, mailservers, etc. using not much more
than the kernel. It's a pretty good use for an old computer, just as
I often use a Falcon or ST as a FAX machine.

Well, I used TOS 1.0 then TOS 3.06, MiNT 1.12.x, 1.15.x and 1.16.x
(with N.AES 2.0.0 and XaAES) and MagiC 5.1, 6.1 and 6.2. Now I use
mostly MagiC. I understand that in your opinion I have no real needs,
and TOS 1.0 would perfectly suit me. Hm.

Your view on the OS users is certainly interesting. Do you really
believe in what you write?

I always thought that the OS (and its graphic shell, for reasons
quite unknown called the Desktop) should be fast, should leave as
much memory as possible for the applications, should be easy to
install and to operate. Should be user-friendly, and, last but
not least, should look nice. MiNT with N.AES is slow, takes as
much memory as possible, leaving very little for applications,
used to be almost impossible to install for an average user
(now with EasyMiNT this situation has changed, but the EasyMiNT
installation needs CD-ROM device, while MagiC can be installed from
floppys).
Is it user friendly... Hm. An average user would like to copy some
files in a background, using the Desktop, in the meanwhile doing
something else. But he cannot do it with MiNT/N.AES/Thing. An average
user need to USE the applications, instead of spending time trying to
set the memory protection flags correctly. And he would get a bit
confused seeing a system message like "Operating system killed".

Well, here comes a STORY FOR ENLIGHTMENT:

"Let's say you're about to buy a TV. There is one that you have to
pay for (called Black Magic), and one that is given free (Wirgley's
Spearmint). However, the one you are (apparently) given free, comes

without the kinescope :-) you need to buy a kinescope from the selected manufacturer, and it turns out that this kinescope is expensive and not very high quality. But you have made the decission, you re getting it (because every one told you this is the best TV around. But they also told you it is free...) After coming home you realise there is no owners manual. There are several leaflets, but they are in Chineese. However, you are being told there is a manual for free, available somewhere on the Internet. You finally download it, and connect this TV. After connecting it, you realise that it takes so much power, that you cannot turn on any other device at home. You call those people who told you it is the best TV, and they say: of course you need to change all your electric installation at home, we have XXI century! Thinking about where to get the money for that, you want to watch something on that new TV. Here comes another surprise, you cannot watch more than the half of your favorite programs. Why? Because this new TV protects you against certain things ;-) You manage to turn off that protection, but you get warned, that such an action is unwise and might be prosecuted in the future. Anyway, now you're watching your favorite channell, but the picture seems to be a kind of slow motion. You call the people who recommended you that TV, and they say: when you change that old electricity installation of yours (XXI century, remember, there is a great one called TCT-90 available, oh, but it cannot be installed in your house, you need to change your house, XXI century, let's move on, shall we?), then you might get the satisfactory results. So you're getting a bit upset, even more when you realise that the remote control is terribly complicated, and certain channells are displayed black and white only. And when your friends start to tell you, please remember, you got the full specifications and schematics of that TV! So you may repair it yourself when anything gets wrong, and add your own enchancements to it - you finally throw it away through the window, go and buy the "expensive" one.

When you come home, you simply plug it in, turn it on, and it works. It doesn't require you to change your electricity installation, it does not protect you from watching your favorite channells, everything is easy to operate, all channells are in color... You are happy with it. But your friends, those who reccommended that previous "free" TV to you, they do not seem to understand it. They say you don't have any needs and a simple radio would perfectly fit you, you are fooled by commercials, and the worst thing is that you insist on staying at your old home with that terrible outdated electricity installation TTT-30. But you don't care... :-)"

This all looks like Linux-Windows wars.

On one hand we have easy to use and easy to install but not very reliable os (windows. Ordinary user who does not woant do do much things on his computer will chose this. On the other hand we have not-so-easy to install and not-so-easy to use os (linux). It will be chosen by people that want to go a bit "deeper" inside their system.

I do not say that windows-like people are dumb- they just does not want to learn anything harder and THERE IS NO WAY TO FORCE THEM. They have ro realize what is best for them, calculate things and then, maek up the decision.

FreeMiNT - MagiC is very similar. fortunetly our systems are compatibile (mostly) so choosing one does not mean you cannot use software written for another.

Yes, I'm geek, I'm programmer and os (comercial or not, doesn't care) that is open-source, that I can improve myself is always better for me.

For me, the most important thing in os are:
- stability
- reliability
- software that I need to use
- speed

In terms of stability and reliability FreeMiNT beats MagiC. this is the fact. If software, there are some rare exceptions that does not run under FreeMiNT or does run partially incorrect. On the other hand please name any good SSH or Telnet software for MagiC. Telnet exists, but SSH not.
In terms of speed MagiC is faster, true but as a programmer I understand why FreeMiNT works slower, and I accept this. Morover, all here are Atari fans yes? SO why stick to old atari hardware when some new is avialible. You can buy a Falcon with accelerator card, and I belive that on CT60 difference

between MagiC and FreeMiNT in speed will be invisible.

I understand that my arguments in software and speed can be easily beaten, so I consider MagiC and FreeMiNT EQUAL in general. We should understand that there is variety of users that have variety of needs, so they need DIFFRENT systems.

At the end I'm stating two points that should be cared by everyone (users&developers):

1. Dont flame or bash someone that uses OS that you do not like
2. Make sure that your newly developed software will run both under FreeMiNT and Magic. They are very similar and you have follow only few rules. Please do so.

Hmm... I think I'll propose a TORG with it. :)

Adam Klobukowski
atari@gabo.pl

Ps. FreeMiNT is better anyway :)

436. New : Icon Extract 1.3

Newsgroup: comp.sys.atari.st
Date: 2002-06-19 14:40:00 UTC
From: lafabrie florent <lafabrie@club-internet.fr>
Message-ID: <3D1097C0.1000200@club-internet.fr>
Source record: 34091

Hello,

Here is a new version of Extract Icon that you
will be able to download on my site. A lot of news to the menu...

Best regard,
Florent LAFABRIE

WARNING : I research for a person for the translation of the
RSC file and the HYP help file. Thank's for your support.

Welcome in this new version,

Novelties :

ï¿½ Support of icons to the XPM format (Linux).
ï¿½ Support of the DRAG protocol DROP and toward INTERFACE.
ï¿½ Support of the DRAG DROP and of a file on the icon of the
program under TOS, Mint and Magic.
ï¿½ Possibility to associate the ICO files, CUR, ANI, ICL, DLL
and XPM to the program (Newdesk, Jinnee, Thing...).
ï¿½ Support of the AV protocol toward ZOOM, RSM and INTERFACE.
ï¿½ Support of the long filenames under Magic and Mint.
ï¿½ Utilization of routines NVDI 5.xx for the transfer of an icon
8 bit in fashion 4 and 1 bit (with or no dithering).
ï¿½ Themes for desktop and windows.
ï¿½ Possibility to see the RSC files in 256, 16 and 2 colors.
ï¿½ Possibility to suppress the window of treatment in order to use
another program in multitask fashion.
ï¿½ New window of information on the material and the used fashion
video.
ï¿½ New file for ST-guide.
ï¿½ By default, the file for ST-guide is read since the repertory
of ICON Extract, otherwise in the repertory of the HYP files
specified in the ST-GUIDE.INF file.
ï¿½ New files of configuration (incorporation of themes of desktop
and window).

Following bug corrections :

ï¿½ Redraw correct of windows of the application under Magic.
ï¿½ Redraw correct of the bar of the main window at the time of a
displacement.
ï¿½ Rewrite of the ICONIFY routines and ALLICONIFY.
ï¿½ Display correct of bars of windows of the other applications
in multitask mode.
ï¿½ Programs is no more blocking in multitask mode.

ï¿½ Programs functions now in all graphic fashions (1 bit to the 32 bits).
ï¿½ The allocated memory is henceforth correct. Thank's to Eric REBOUX for the MEMDEBUG program.

Contact me by email: lafabrie@club-internet.fr

I think you missed his point here. He was saying that there is a difference
between open source programmers and commercial programmers. It's called
market force. In open source, if the programmer likes it, it stays, no
matter what end users think of it. In the commercial world, if the end users
don't like it, they won't buy it, hence it will not stay (i.e. the
programmer will change to fit the users' desires and demands of the
company's CEO or get fired). So in open-source, programmers ultimately have
total control, and in commercial programming, the end users ultimately have
control. All of the examples you used above are from the commercial
programming world, so of course the end users will like the final result,
otherwise the programmer is out of a job. Your PS2 game example, for
example: If the programmers didn't buck up and find their way through the
difficult hardware problems and make something the end users would enjoy, no
matter what nifty programming tricks and loopholes they had to ingeniously
come up with, the company would have been out a ton of R&D money, and the
programmers' jobs might have been in jeopardy. If this project was open
source, the programmers would have either dumped the hardware or modified it
to make it fit their needs. Of course, computer programming (especially

Atari computer programming) has much different dynamics than commercial
video game programming. Video game buyers are much more demanding of quality
and user-friendliness. In the end, it's the game machine that has the most
flashy graphics, easy-to-use interface, and best game play that wins (oh,
and marketting plays a big role in that as well, as any fan of the Atari
Jaguar can attest). Open-source has no market controls like that. Something
is made, and distributed when finished no matter who likes it or dislikes
it.

That's a gross exaggeration if I ever saw one. I know of very few who only
use their computers for that (save the odd elderly person who only bought
the computer because their younger family members insist on using e-mail to
communicate). I know for a fact that most end users these days are a little
more sophisticated than you give them credit for. And of course a programmer
was a user first, but as a programmer they have a completely different
perspective on a program, and often have completely different priorities
than the end user. I think the biggest difference between programmer and end
user is that programmers tend to concern themselves more with programming
dynamics than with aesthetics (as they should be up to the point of
releasing it, at which time they'd better have an interface the user will
enjoy using), and end users are the opposite (as they should be). As a
non-programmer, I personally would rather have a nice-looking and easy to
navigate interface without having to spend the better part of a week reading
a cryptic manual (or worse, a unix-like "man" file), while a programmer
might be more interested in making a line-completing CLI that most end users
won't use anyway and quickly typing up a manual in their native
"programereze". This is extremely evident in the Mint world, for example.

> That's your average Joe.
> Average Joe who uses his computer once a week does not even care about cut
> and paste keyboard shortcuts, no big deal, "I'll just type it, I'll never

Not true at all.

> Command line completion in shells. How long did it take for DOS to have
> this simple feature? Well, no one care, coz no one really uses DOS
> command line anyway.

Exactly. So why even make a point of it if it isn't used? That's the thing.
No matter how much a programmer puts into something, if it isn't something
that your average user (not this Joe guy you keep refering to ;)) can't
make aesthetic sense of and/or won't use, then why waste your resources?

> The average Joe basically has no needs and couldn't care less about OS,

> to set it.

This poor Joe guy must be a real dunce. Anyway, the real average user uses
an OS all the time, even your Joe must interact with it at some point.
Microsoft aside (as it is a relative anomaly, I think, even if it's the
biggest anomaly out there), most companies will hire programmers with a good
sense of end users' needs as well as good programming skills. That's why our
current definition of a "modern interface" looks a lot like the standards
set in the Mac/PC world, not in the Unix/Mint/Atari/etc world.

> Second point:
> You don't change a winning team.
> If it ain't broke, don't fix it.

But to most end users, even if it ain't broke, if it looks bad or out-dated
and isn't easy to use, why keep it around when there's something nicer
looking and easier to use?

> Unix has been working for 30 years, been proven in the industry to this
> day. Still in use, still selling very well, hardware, OS and services.
> Same thing with AS400 and mainframes, as old and outdated as they may
> seem, they just work.

But Unix is only selling well to companies who hire techies to make sense of
it, programmers who speak its language anyway, and the odd duck who's just
curious and has the time to figure such things out. How do Unix sales
compare to PC/Mac sales in the end-user market? Unix *is* powerful. It
does work well, depending on its venue. It just isn't practical for most
people out there.

Ok, he is basically saying that Magic is easier for the average end-user to use than Mint and fulfills their needs. How is he wrong?

> They prefer magic because:
> 1) magic is commercial and has had advertisement (I myself was fooled
> years ago when I bought it), I truely believed the ads until I tried for
> real.

What were you deceived about? Magic pretty much works for me as advertised. Although I never saw all that many ads. I just heard from a lot of people that they liked it and thought I should give it a try. Although I had some problems at first, I found ways to fix them. And I'm fairly happy with my Magic setup. I also use Mint from time to time (which is what I used before Magic), but not as often anymore.

> 2) because people don't have any needs, so anything will do. Magic or
> singleTOS 1.0 will perfectly do for them as they don't have any
> particular requirements.

Wait a minute, doesn't this fall under the "easy to use and fulfills their needs" argument that Iggy was making? And what requirements besides programmer-centric ones does Magic not fulfill? Also, I hate using SingleTOS now that I'm used to a multitasking environment, and only use it when absolutely necessary. I think that once again, you way underestimate the average user. Especially in the Atari world, the average user has a lot more sensibility for the issues a programmer deals with than your average PC and Mac user. But they still want something that is easy to interact with, which Mint is not at this point. Magic is. It also works relatively well.

> 3) because the hardware requirement can be met very easily with magic.
> (example: I have an old Pentium one 75Mhz, with 24meg of ram, and windows
> 95 is installed on that, does that mean that windows 95 rules?)

You are comparing apples to oranges here. Windows was never all that great, while Magic was at least very usable. And it is extremely easy to pick up a cheap PC that fits your needs than a cheap Atari that fits your needs. And PC users don't have much choice for which OS to use, while Atarians have a number of variations they can choose from. So as most Atari people still use their old ST's and need an OS that will work and run most software, most PC users will upgrade their PC's because most software won't run without upgrading Windows, the Windows upgrades are expensive and probably won't run on their machines, and it's probably cheaper to buy a new (or slightly used) one anyway. And yes, there are those who are happy with their Windows 95 arrangement.

To sum up, open-source programmers tend to overlook the aesthetic needs of the end-users, end-users can't make sense of much of what open-source programmers put out, so while the end-user would like to have a powerful OS and powerful programs to use, if it was all open-source they wouldn't be able to use it anyway. Commercial programmers *must* be aware of aesthetics or they are out of a job, so they tend to be appreciated more by the end-user. Magic fulfills needs, so does Mint, so does ARAnyM. They just fulfill different needs for different people. So what's the problem?

I think most non-MiNT users keep mistake MiNT and MiNT-net. Setting up a
basic MiNT/N_AES is as easy as setting up MagiC. In fact I had more
troubles to get MagicMac running then FreeMiNT/N_AES.
Setting up MiNT-net is something else ofcourse. This is for the common
user not that easy. But nowadays with MiNT-net for Lammers
and the EasyMiNT package it's rather easy.
I guess it's that easy as configurating MagicNet.
Anyway MiNT-net isn't required to run MiNT.

Again when one uses a MiNT/N_AES environment one can make use of all the
protocols available. Even ASH scripter works for a great deal. I'm using
MiNT the whole day. There are days I don't have to touch any command
script but I'm very glad I've a full MiNT-net setup. For my work on the
Belgian ftp-server I need ssh and sftp. These things aren't available
for MagiC. Working with these apps requires some typing but so what...
It's fun.

CU,
Martin

It's not exactly that simple. Some programmers have a boss and a marketing
department telling them what to program, some programmers code OS kernels in
their spare time.

>If the coders are happy with some libs, some GPL code, some IDE whatever.
>The users will definitely appreciate that, as they will see a difference.

It's still failed to penetrate the single largest market; the single desktop.
The only semi-successful attempts so far have consisted of actually hiding the
UNIX system from the user.

>> Making MiNT easy to use and install isn't a priority to
>> those who are already using and directing the MiNT project. Likewise, those
>> who have made easier Linux distributions are mainly commercial enterprises.

>trying to make a buck.
>What's wrong with that?

Nothing really, that's what I'm trying to tell you. You are the one who seems to be opposed to it, what with your radical open source point of view.

>Who'll be making a buck on making a distribution on MiNT (based on open
>src OS)?

As an end user, I don't care. The devil himself, for all I care. Until the MiNT team or the devil gets their act together, people won't be converting to MiNT in any bigger numbers.

>MagiC being 100% commercial can't do it, what makes you think it would
>work for MiNT?

MagiC can do it, AFAIK. It is easy to use and easy to install. Its user base is ample proof thereof.

>All that for what? some people bitching that they can't run it
>anyway on their 520ST.

Welcome to reality!

>> Why do you think non-technical users are preferring MagiC? On technical

The very same argument could be used against Linux, the single most successful open source project.

>2) because people don't have any needs, so anything will do. Magic or
>singleTOS 1.0 will perfectly do for them as they don't have any
>particular requirements.

Once again, you display your low regard of non-programmers. That is the biggest single stumbling block of open source - stuck up programmers who couldn't care less if only they themselves were using their application.

>3) because the hardware requirement can be met very easily with magic.

I wonder why open source projects always are so resource hungry. Windows envy? Their origins on super-expensive minis and workstations?

>(example: I have an old Pentium one 75Mhz, with 24meg of ram, and windows
>95 is installed on that, does that mean that windows 95 rules?)

Why would anything with such absurdly high requirements rule?

I don't think I said that, but now that you say it, it's quite true. In case
you don't believe me, install Slackware 3, than some current distribution.
Come back with your results.

>To which I replied that it is as big as you need it to be. The kernel size
>is irrelevant as it is tiny. The distribution gets bigger coz you get more
>packages, more software. That does not mean you need to install them all.
>Just means they are there if you want to use them.

You think the Linux kernel is tiny? It's a bloody monolith kernel, I implore
you to come up with an even larger kernel.
The distinction between kernel and packages is very uninteresting to anyone
but the kernel programmer. Before I encountered Linux, the only �kernal� I
knew was on the C64.
The definition of the OS as the kernel is really only relevant in a
traditional UNIX monolith kernel environment. Such a kernel will contain all
maners of more and less useful services, whether you'd expect them to or not.
But it won't be of much use, since it doesn't make up an environment.
The environment, that's the layman's definition of the OS. Yes, it's got a
kernel or a load of d�mons or some equivalent mechanism somewhere deep within
which takes care of the hardware and enables the environment and its services
to run, but you don't type �ls� into the kernel, you don't point and click on
the kernel.
What we usually mean when we say �Linux�, is GNU/Linux; the Linux kernel and a
GNU userland.
Now, let's put together a computer with Linux and a useful GUI. The only
remotely useful GUI for Linux is X-Windows, despite all its weaknesses. And
a GUI is a minimum requirement for a serious system since the eighties. The
Atari has taught us that much. This will make MiNT seem resource conservative

by comparison, even Windows would probably pale.
Running Linux and X on a TT030 isn't much fun.

>Why not ship ldap? smtp etc, doesn't hurt. Just more conveniant if you
>want to use them and already there on CD, so you don't need to download
>them from the net.

By all means, put them on the CD, but don't make them part of the default install. I can't understand why the otherwise minimalist (well, it's not minimalist in size terms...) NetBSD distribution always install Sendmail for you and runs it in the background. How many normal computers run an industrial SMTP server? How many users would like them to?

>If magic came with papyrus, da's layout, papillon, Jinnee, emailer,
>Pascal and Aniplayer, would you say that magic is bloated? I don't think
>so. Just nice bundle I say :)

A very nice bundle, especially compared to a Linux bundled with Sendmail and Apache. ;-)
But I draw a rather marked line between the OS (environment) and bundled apps.

hmm, ok. Implored you have, results I'll give you.
I just check on this machine for example, (not looking very hard mind
you).

Irix kernel 6.2 = 3 meg
linux 2.2.x = 1.6 meg (not even recompiled, (which is much bigger
than what it should be))

Now consider that PC architecture is just a big mess, and users can run
any combination of hardware. sgi, mac, atari have no excuse as the
hardware is much more controled.(but that's another thread).

NetBSD?? I thought we were talking about Linux being bloated.
Could you stick to the thread please?
Besides, how hard is it to really remove a package you don't want to run?

Benny,

My first atari was one of these such 520ST's. And although my experimentations fried this machine a long long time ago, I still have the manual at home and will get that pinout to you.

Mark

PS: Whatever happened to cool companies putting stuff like pinouts in their user manuals!?

Lyndon,

Having toasted an AT PSU in the past I will stick with my advice. I guess modern PSUs have to cope with a wider range of loads and may be more tolerent of being unloaded. Better safe than sorry. I was going to say a disk drive should be enough, but I was not sure about modern drives....

Dave.

Couldn't find this via a Google search (turns out Google drops the "."
and searches for every instance of "st"- you can imagine how many
articles THAT turns up..!).

What archiver should I use to restore .st disk image files..?

Is there one good one that can deal with multiple styles of disk
images?

Thanks!

BobR

For what kind of computer ? ST or PC ?

On an Atari ST, you can use JayMSA, it can deal with .MSA, .ST
and .DIM files.
Check this : http://phoenix.inf.upol.cz/~opichals/jay/

See you

Having built a.....few 2U rack cases I would advise that whilst a simple ST
will fit there ain't a lot of room for ' add-ons' in a 2U once the floppy is
moved to the front.

4U is a much better bet, especially if using a PC psu.

I have some suitable cases in stock.....ooops.

Source record: 34011

I have a 1040STfm with a color monitor. I recently dug it out of the basement and found my big stash of floppies that I thought were long gone. Been 12 years since I turned the system on.

Fired up, desktop in 3 seconds! :)

I need to find a cheap hardrive solution for this system. What would be my best route besides a Megafile or something like that?

Lannie

PS Been so long I couldn't remember how to do even the basic things on it!

Alright this is kind of hard to depict but I will try

6 x 7x
1x 3x
4x 5x
2x

That is the pinout from left to right looking at the computer... so the order from left to right, counterclockwise is 6,1,4,2,5,3,7.

The pins are as follows:
1 - +5VDC
2 - Not connected
3 - Ground
4 - +12VDC
5 - -12VDC
6 - +5VDC
7 - Ground

All of these voltages should be found on a PC power supply or another atari power supply.

Hi!

I will preface this by saying, I am by no means interested in restarting the whole Mint/Magic war. I'm just stating why I tend to use Magic more than Mint. I have and use both. I just prefer Magic...

in article 1fe1l6t.hxicxf1le5y3aN%tos4ever@pandora.be, Martin Byttebier at tos4ever@pandora.be wrote on 6/19/02 11:05 AM:

> I guess it's that easy as configurating MagicNet.
> Anyway MiNT-net isn't required to run MiNT.

Actually, I used Mint before using Magic, so I know what Mint consists of and how it is different from Mint-Net. My point was, Magic has a GUI-based installation program and configuration programs. I've never once *had to* edit a config file on it, although you could if you wanted. Mint (at least all the distributions I've seen) was a little more complicated. If you wanted to just use Mint with a GUI (NAES, Geneva, AES 4.1, whatever), you must edit Mint's config file to get the features you want (or does NAES have GUI-based configuration programs? I've not used it, as they don't sell it here in the US, and I don't like doing overseas transactions). If you go with a distribution, you invariably have to create a Linux/Minix partition (which isn't always obvious how to do), assuming you have a partition that is free to erase (I didn't when I first started - I tried again later after buying a new hard drive). then you end up with all kinds of Unixy things you don't necessarily need. And, although it really isn't *too* incredibly difficult, it does take some practice to figure out how config files work, especially Mint config files. So in this respect, Magic is much easier to set up than Mint. As far as stability problems, I had similar problems with both, and their solution was the same - play around with AUTO/ACC/CPX folder order and program compatibility, and you will eventually have a stable setup (I wonder why someone hasn't created a program with an updatable library of all AUTO, CPX, and ACC programs that exist, that automatically places these in the optimal order/configuration for your OS...).

>>> 2) because people don't have any needs, so anything will do. Magic or

> Belgian ftp-server I need ssh and sftp. These things aren't available
> for MagiC. Working with these apps requires some typing but so what...
> It's fun.

For me personally, I found that I never had any use for Mint-only software. As it is pretty much Mint-Net or text-shell related, I can understand why. I always hated CLI's and text-only interfaces ever since I began working with my original ST and got used to a GUI (not that CLI's aren't useful for some, I just can't stand them). I also could never get Mint-Net working. I do have MagicNet working, but when I tried to use my knowledge of how MagicNet works to get MintNet working, I still can't get a connection.

I also find that Magic works for most things I use, and Geneva works for the rest. So I don't really have anything that requires Mint. Magic also looks nicer and feels faster, both of which are important to me as well as being able to run everything I need.

So my whole point is, while you can fairly easily get a Mint/NAES setup running, Magic is just that much easier. Both work perfectly fine, and Mint does have more powerful apps if you can get past the CLI-angst that people like me have. But for someone like me, Magic makes a better choice.

The SGI O2 is sweet hardware, but you'll be surprised by the OS and apps.
Be ready to spend quite a lot of money for apps as you can't find
"cracked" ones (flex licenses and all that), or deal with open src apps.
Also, the speed ain't that great at all. You'll be able to run STonX at
almost decent speed.
What irix version does your O2 come with? (6.2 or 6.5.x)

Compared to NetBSD, Linux really is, don't you agree?

>Could you stick to the thread please?

Please point out where I don't.

>Besides, how hard is it to really remove a package you don't want to run?

Tell me, and tell me about dependencies. How would I know that removing some
seemingly useless text-formatting packages with non-descript names lik GROFF
could remove the ability to read MANual pages?

An external SCSI HD will work nicely, if you can find a Link adapter
(about $100, but not easy to find).

A cheaper version that actually works quite well is an IDE board --
they are also a bit tough to find, and you have to do some installing
(soldering?), but considerable money is saved.

Please note that you will be limited to 14 partitions of 256Mb each
without additional software. Still, on an Atari, that's huge (my
daily computer, a Falcon030, has a 230Mb hard drive!).

> bloatware?

No, it doesn't. Note I said "not much more than the kernel." I agree
that Linux is starting to bloat as badly as Windows, but fortunately
Linux is a modular system, which means that you can toss the stuff you
don't need to gain some speed. As a relative Linux beginner, I
haven't played with it much, but I know it can be done.

That said, I run Geneva, Mac OS 7.6.1, and RH Linux 7.2 at my house
and prefer my Falcon with Geneva for everything except web access and
digital photo reading, which are done by the Linux box. The kids use
the Mac for their educational software. Still no MS within my walls,
and I hope to keep it that way.

Using quotes around the term - like ".st" instead of .st - helps a lot.

> What archiver should I use to restore .st disk image files..?

I've found dd to be a mighty tool.
Seriously, .st files are just bitmap file images of the original disk.
On my Linux box, for an 820K .st image:

fdformat /dev/fd0u820 ## low-level formats floppy to 820k
dd if=myprog.st of=/dev/fd0u820

Be careful; on most PC Unix OS's the standard floppy device, like
/dev/fd0 in Linux, defaults to 1440k. You'll need to name the sized
device explicitly as above. FreeBSD and NetBSD work similarly.

BTW, dd doesn't work with .msa files.

This is something of a long shot but here goes...

Many years ago - around 1994 - I ran a short-lived science fiction disk magazine called NovaDisk. It was mainly occupied with Star Trek and had about 10 issues.

I've recently been feeling pretty nostalgic and wondering if any copies of this are still in existance anywhere. I've searched the web and newsgroups but only found a couple of mentions so I thought I'd post a request on here.

If any of this sounds familiar and you think you may have a dusty old copy of this somewhere, or you can suggest any other avenues to explore, I'd appreciate the feedback.

Thanks for your time.

I once heard you can use the PC's hardrive and [printer and etc on the ST
using cables and a utility. Maybe this would be the way to go. Anyone
heard of this and how to make the cables?

I'm getting this error when exiting Newsie, or sending news:
Program returned 68000 error -69. I can run the program and exit fine if
I don't dial (I use STing 1.26). If I use the dialer, I get the error
every time. Any ideas?

472. ST with VGA Monitor?

Newsgroup: comp.sys.atari.st
Date: 2002-06-21 17:21:27 UTC
From: nurmix@spam-free.com
Message-ID: <3d135f9e.5508994@news-server.socal.rr.com>
Source record: 34031

I know Mario Becroft made an adaptor to allow connecting a standard
VGA monitor to an ST. Does anyone know if this is still available?

Also, if not, are there any other alternatives?

I'm asking for a friend with an STf, who only has a color monitor, and
wants to run Cubase.

I've seen "multisync" adaptors from Best Electronics, and WizzTronics,
but would these _also_ allow a standard VGA to be used with an ST to
utilize HIGH resolution? He doesn't need to use LOW or MEDIUM on a
VGA monitor, only HIGH.

You may have to reformat or rather repartition the hard drive to
be PC-compatible. HDDRIVER offers this option, but can only use a
single partition. No good if this is the hard drive with your
programs on :-(If you can get one, perhaps an answer would be a
SCSI SyQuest or ZIP drive, suitably formatted.

>Using quotes around the term - like ".st" instead of .st - helps a lot.
>

Unfortunately, Google's implementation seems to IGNORE quotes-

If you try to search for a phrase by placing it in quotes, you'll get
tons of pages with those words, but scattered independently as if you
hadn't quoted the search phrase.

And in this instance, Google seems to ignore the punctuation (the .)
completely, leaving it only searching for the phrase "st"

I've found that Alta-Vista and Yahoo seem to implement searching for
quoted phrases properly, but I didn't try them in this instance (to
see if they'd include the period).

>> What archiver should I use to restore .st disk image files..?
>
> I've found dd to be a mighty tool.
> Seriously, .st files are just bitmap file images of the original disk.
> On my Linux box, for an 820K .st image:
>

Interesting..! I'd assumed there was some file compression going on
because the .st files are of different lengths. Perhaps they just
ignore empty sectors to save space and time.

I'll keep dd in mind, if I ever get around to installing Linux
again.. :)

Thanks!

I'm looking for a utility to convert large audio files recorded at 49KHz to 44.1KHz so I can write them to CD. I thought the program 525 was going to do this, but it will only write a 2.5 MB file. Most of my audio files are 70 MB+. I am recording the audio output from MIDI sequences to my Falcon with FreeRec, and would like to be able to write them to CD with CD Writer. Any good, (hopefully readily available in the USA) solutions?

Note that the restriction with a single partition is only relevant if
you do not run MagiC or MiNT. With MagiC or MiNT this is not an issue
and in this case you can access PC-compatible drives with multiple
partitions with HDDRIVER without having to repartition.

Hi !

Just a word to say that I started wrinting some articles about using VISION.
These articles are available at MyAtai.net
(www.myatari.net/issues/jun2002/vision.htm.).
This first one deals with album managing.

Many thanks to Mathhew Bacon for improving my English !

You may also have a look at VISION's website : www.vision.atari.org

See you, Jean

What version of 525 did you used? I converted 20/30MB WAVs with 525
ver. 2.13. It took a *very* long time, but it worked well.

I have a very similar setup working here. It's an Ethernet solution and uses
MagixNet plus a utility called Samba. Look on Vassilis' home page:

http://users.otenet.gr/~papval/

You can't run programs from the PC's hard disk BTW, only use it as storage or
as a transfer method.

Cheers

Hello,

From what what I haave heard, the cable is still available and only functions
in te HIGH mode. I have hooked up my STe to a VGA monitor using an old piece
of hardware called a Video Key. I also needed a video convertor which I bought
from Matco.

I have 525 2.13. Perhaps it is a limitation of the unregistered version
that is not mentioned in the DOCS? I have been unable to reach the author
by web or e-mail to register. It writes the exact same size file (about
2.5 MB) no matter what I try. I am not converting the file type though,
I'm just trying to change the sample rate to 44.1KHz.

I want to convert the sample rate to CD (44.1KHz) in a format that
CD-Writer can use (I think AIF and AVR are the choices). None of the
recording programs that I have found can record at 44.1KHz without an
external clock.

I may buy the more "pro" gear and software for my Falcon eventually,
but I can't justify the cost yet, since I have a complete Logic Audio (too
bad E-Magic dumped Atari) setup at work. I enjoy my Falcon so much more
than the PC stuff, but I never dreamed that I was going to end up spending
as much as I have! Sure is fun though!

Joseph,
I would suggest to you Aniplayer version 2.19!!!
What file format are you using???? What file formats
are you working with and what would you like to
convert them to???? 525 may also be the only choice.
Aniplayer only allows you to convert file types not
the sample rate. I will do some investigating, I have
this 525 program. Dont use it much since I can
convert MP3's to WAV's with Aniplayer just fine!!!! I
will let you know what happens!!!! Once you get this
newly converted music files to CD then there are much
better conversion programs out there like CDP and
PlayMyCD can export and change file types and sampling
rate and even if it is in MONO or STEREO or such!!!!!

Thanks,
Carey Christenson

Working really well here. Had some worries as my ISP just
changed to CHAP but setting my username and password in
chap-secrets (put your password in double quotes!) got me back
online. Follow the docs, and use devset.prg in the auto folder.
Keep the etc folder on your VFAT partition with long file name
support and keep it on same partition as aFTP I think. Put the
folder etc on the root too of that drive. If you set up mintnet
you should find it easier, less files.

Hi Grzegorz,

>Is it possible to use Mustek 600 II N scanner with Atari TT?
>Does it have SCSI interface? I heard both that it does, and
>that it does not ;-) Can I connect such a thing to my TT?

No you can't....
The 600 II N model doesn't come with a SCSI interface. The Mustek
scanners with a SCSI interface, all carry an "SP" tag behind the
identification number. I.e.: 600 SP, 1200SP, A3 SP etc...
The A3 SP model is the only SCSI model which is still for sale, USB
is taking over rapidly...
If you do find an "SP" model then note that you'll also need the NOVA
Scanner driver which is the only one available that can address the
Mustek (SCSI) scanners. The same driver can also address the HP range
of SCSI scanners...

Cheers from Belgium
Dennis

yeah thanks.
Next time try to understand, instead of being the csast referee.
Actually I don't expect you to understand at all, so that does not
surprise me.
Have a good day, and tell me where I can pickup this prize.

Ah!!!, maybe i shouldn't have uninstalled CuteFTP and killed all its
registry keys after all!!.

I was having trouble with another site i frequent as well, and have done for
some days, so i assumed that cute had barfed!!. Oh well.

Hi all-

I've been thinking about asking this for awhile, and this seems an appropriate thread.....

I have some stereo audio files recorded with Atari Logic Audio. I would like to be able to convert them into WAV or AIFF in order to put them on CD. However.... Logic makes stereo files as TWO seperate files. I've tried 5-2-5, but I can't find a way to combine the 2 files into ONE stereo file. They were already recorded at 44.1, so no need to change the sample rate. Any ideas?

Thanks,

Clayton Murray
Seattle, WA USA

Joseph,
I did find 525 program in my archive. Since I did
not have unzipped. I went ahead and did that. I have
not used 525 for quite some time. I forgot how nice
the program is. And I also figured out why my MP3's
that I convert to WAV format with Aniplayer will not
copy to a CD!!! Because the sampling rate is 49,170.
So I converted a WAV that was once a MP3 from 49170
to 44100 and now it will load into my CD software.
Thanks for reminding me of this nice piece of
software!!!!! It did convert my size as well on this
file. Did you checkmark frequency and tell it
44100???? Did you also tell it what file format to
convert to and to keep the 16 bit stereo file
format??? Just suggestions, let me know how it goes
for you.

Thanks,
Carey Christenson

I've tried different file formats, and I'm using 16 bit signed motorola,
convert to 44,100. No matter what I do it writes at 2.5 MB file.

I think Copson ZeroX will do that (combine), and perhaps
Squash It! (Electronic Cow, freeware). I'm not very familiar with these
sample editing programs, but perhaps someone else is? Are you sure Logic
doesn't have an interleave option when you write the file? I know my PC
(Logic Audio Gold) version does.

526. HighWire 0.05 released

Newsgroup: comp.sys.atari.st
Date: 2002-06-24 22:34:06 UTC
From: RobM <rmahlert@charter.net>
Message-ID: <uhf70fei8ntt15@corp.supernews.com>
Source record: 33986

The HighWire Development team is proud to announce the latest release of HighWire 0.05.

With this release, HighWire now displays GIF images. GIF support required a bit of porting work for the team, but we now have the most current versions of Zlib and libungif working for LatticeC, PureC and GCC. These will prepare the way for even more supports in the future. With GIF files displaying in HighWire, work was required on the IMG tag support. There are still some problems with the IMG tag currently. But they are not related directly to GIF support and are of a more general nature. There has been and will continue to be work in this area.

Text formatting was another major area of work in this version. Problems with justification, alignment and colours having been dealt with. Work was also done on lists and their display. Not to mention low level improvements on font sizing.

Bugs were eliminated at a furious pace, with more bug reports being eliminated from the bugtracker site than in any previous version. Small problems with GDOS detection and redraws were dealt with among others. The final result being a general improvement in the function of the program.

To download, visit the download page on the HighWire site at http://highwire.atari-users.net

HighWire Development Team

No, not for single tasking. NAES and MiNT are a whole new world. The
:(was due the to the fact that the current ethernet driver does not
function under MiNT.

Source record: 33988

Due to my provider decision, next month my flat-rate connection 56k will end, so I'm turning to ADSL. I've a Mac, a PC and the Falcon. With ADSL, I will buy a Zyxel Router (645R) to share the connection. With Mac and PC there will be no problem, but with the Falcon.... My Falcon run with MultiTOS, and I'm thinking about the EnterNEC adapter to connect to the hub/router. But, there's a way to go internet with the router and the multiTOS? Please help me :-)

Apart the partition/space problem, I've a question: the Falcon didn't have
only two ide interfaces for 2.5" HDs?

I mean, not the 'standard' ide for the 3.5"?

ah contraire - still interesting and vibrant as ever.

Compare this to The iDiot Forever Known As Sinclap, who, after all
these years, still shows his lack of ambition and utter stupidity by
hanging around Atari nesgroups trying to get a rise out of them, only to
have his ass served back to him on a platter with a side of mint sauce.
Not to mention his tendencies to pick the wrong people and things that
will "crush Atari" who were themselves crushed. In other words, TiFKAS
is nothing more than a pimple on the buttocks of progress, and a
mumbling crank whose expiration date long passed.

Plumbing is an exciting field, TiFKAS - look into it.

After not bothering for a while, I decided to get MagicMac 6.1.5 running on my Powerbook 180 (14/120Mb running System 7.6, if that matters). Things run well enough, but I keep locking up the computer with "Sorry, a system error occurred. Magicmac error type 11." This error is quite rare if the computer is in constant use, but is guaranteed to happen within a hour of letting MagicMac run idle, and occasionally occurs as quickly as 10 minutes after leaving the computer.

Any ideas? I have removed anything resembling a screensaver and have turned off power management. What on earth is a Type 11 error?

The Falcon has one IDE port, which supports two IDE/ATAPI devices. With
an adapter you can use 3.5" drives.

536. Question about TT graphic card

Newsgroup: comp.sys.atari.st
Date: 2002-06-25 06:34:18 UTC
From: Grzegorz Pawlik <atarirulez@go2.pl>
Message-ID: <3d180fd02d62b0@go2.pl>
Source record: 33995

Hi,

I have just got a graphic card for my TT. It consists of a sorf of VME-ISA interface and a PC (I suppose? It is written "Adax Personal Computer" on it...) graphic card with ET-4000AX chip. Works great and much faster than original TT display, I can even *play* DOOM with that! :-)

The problem is that it hangs the computer after a while, mostly when I move GEM windows (in TOS, MagiC, MiNT+N.AES...). The ET-4000AX chip gets very warm, I guess it isn't normal? When I play Doom ;-) it does not hang the system, but it switches off the display after some time (Doom does not hang, it still works but without the display). What is wrong, what can I do about it? Placong a fan over the TC-4000AX didn't help BTW.

Another problem is that the NOVA 2.97 drivers do not work. The card came with its own drivers, which are similar to NOVA (EMULATOR.PRG and STA_VDI.PRG). I cannot use VMG-4000 (a NVDI tool) to make NVDI work with this card, because this program says "Fur den korrektier betrieb auf der grafikkarte, ist ein neuerer XVGA-treiber notig." What does it mean?

What can I do with this card to make it work stable? And work with NVDI 5.03?

Thanx for any answers.

537. Hot to put Atari ST files on Hotline?

Newsgroup: comp.sys.atari.st
Date: 2002-06-25 07:05:26 UTC
From: mrdelurk@aol.com
Message-ID: <mrdelurk-ya02408000R2406022112230001@news-server.hawaii.rr.com>
Source record: 33897

I have a small Hotline server with various MIDI and music-related orphanware. So far we have PC and Mac files and synth/sampler sounds. As a long time Atari ST user, I have a kajillion Atari ST floppies, some of them clearly orphaned software. The question is, what is the best way to upload these to Hotline?

I can read the ST floppies with my Mac's FD and throw them a folder on my server in a second, that isn't a problem. The real question is, if any consensus or standard how Atari ST files should be prepared for online sharing? Should I compress them into ZIP format, or maybe I should make a disk image of the floppies with Toast, or... - ?

538. Atari ST hardware in Australia (crosspost)

Hi guys,
I own an Atari ST 1040fm, and I'm interested in getting my hands on some more Atari gear, namely a 1040 STe, an Atari monitor and a SCSI adapter or an ASCI ext harddrive of some description.

Could someone point me in the right direction here? I've searched most of the day (in between working while the boss walks past and no luck.

Any help is greatly appreciated.
cheers
Sciby.

Source record: 33903

Hi all!

Finally, now MyMAIL works fine with MagiCNet and MagiCNet/GlueSTiK. After weeks of test and problemsolving by Erik Hï¿½ll he finally made it.

The problem was not in MyMAIL itself but the way MagiCNet/GlueSTiK works with TCP. He adopt MyMAIL and the latest test today makes my system and MyMAIL to bring attached files as fast as any modern system, through my LAN and Internet Cable.

Well done, Erik. I am a ASH Emailer fan but I do use several accounts and therefore need a another e-mail app aswell. :-)

This new fast MyMAIL version will be released at our Computer Show this very weekend http://www.sak.nu

Whatch out additional info about the convent at my homepage later today and NAS on-line events during the show. http://mille.atari.org

Best Regards

Mille Babic

>Does anybody knows how is this activated (a combination of keys, I suppose)?

You need the driver disk, which does the necessary. You'll also need a copy of
DOS of course.

I have a copy of the disk which I can email to you if you wish, email me with a
working address to send it to.

Cheers

Derryck

Which stack do you run at present? The EtherNec card has drivers for Sting
and MintNet so provided there is a network stack which will use those
drivers you should be o.k. The default Zygel configuration reserves local
IP address 192.168.1.2 through 192.168.1.32 for static allocation so pick
one of those for your Falcon. Set the default gateway to 192.168.1.1 (the
default address of the Zygel). If your ISP provides static DNS add those,
otherwise point it at the Zygel as well.

I assume you set up the address OK for registers and memory? I
don't know what they're meant to be for the particular adaptor
you have. Unless you have some nvdi.inf file already with them
in.

Where to take it from? I installed NOVA 2.97 but it didn't work.
The one I use seem to be NOVA 2.12 (that's what is written in the
NOVA cpx module).

> Are you sure the term is "Korrektier" ?

It's "korrekten"... both does not mean much to me ;-)

Hi,

I'm just compiling a list of all the Amiga/ST magazines that have ever reviewed / previewed Thalion games, or run articles on the team.

Information is not readily available, and thanks to several mates, ebay, and AIM (http://home.hia.no/~jafrohol/magindex.html) I was able to produce a basic list, mainly of English Amiga magazines.

There are lots of missing entries, and entries with missing information, if you own any Amiga/ST magazines, and could take the time to help "Fill in" the gaps it would be much appreciated.

Cheers

Indeed... perhaps will the following do ?
ï¿½This graphic card needs a newer XVGA driver to run correctlyï¿½
However... this won't help you making it work.
Hey! I just realized that the message comes from NVDI, doesn't it ?
So, maybe your NVDI is too old ? And, maybe a newer one will help ?
Unfortunately, I can't do much more for you :-(

I just bought today a UMAX scanner for 25 euro's
or $ 12. Are there any drivers for to connect it
to a TT? I till use a Epson scanner but this was
such a bargain....

Thanks,

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

And how can it do that as as far as I know none of the ST/TT/Falcon IP
stacks support DHCP (Sting certainly does not) so whilst the router can do
all that for many machines you have to hand craft it in the Atari world.

LZH and ZIP are both used on the ST. Unless the program in question requires
the floppy integrity to be preserved, just ZIP or LZH/LHA its contents.

556. anyone still has NOTATOR ALPHA

Newsgroup: comp.sys.atari.st
Date: 2002-06-25 22:29:17 UTC
From: Alan <alan_vonlanthen@hotmail.com>
Message-ID: <3d18ee60$1_4@news.bluewin.ch>
Source record: 33914

Hi!

I shouldn't have done, but I did... I lent my old Atari 1040 STE to a friend, and he managed to lose the single disk I had containing Notator Alpha. I still have the dongle and everything, I just need a copy of the disk containing ALPHA.PRG.

I found tons of stuff on the internet, and also discovered (with great pleasure) that I'm not the only atari-nostalgic on Earth, but I couldn't find this specific program...

Could anyone send me a zip archive of that disk?

Thanks ever so much!!

a.

I don't really understand if you're trying to refute what I say or if you
actually concur.
Oh well, I'll go with the former.
The router is the one talking DHCP, PPP over Ethernet and all other weird and
wonderful contraptions which the broadband ISPs enforce in order to lessen
their number of potential customers. It will then route and masquerade this
onto your own LAN, where you may run DHCP, if you so desire, but unless it's
been designed by some utter pervert, it will also facilitate use of non-
public, static IP addresses, which even a 1982-vintage TCP/IP stack will
support.

Hi,

I have the following items for sale:

* Minx Mp3 Player (Same as: http://www.mp3.com.au/shop/purchase.asp?id=200
except 16MB), boxed with all manuals, usb cable, comes with 16MB but has
2 MMC Slots for adding more memory. Takes one AAA Battery, weighs only
38grams, has 5 preset EQ settings. Comes in original box (opened). $145

* External 100MB Parallel Port Zip drive and 2x100MB Zip Disks, comes with
all software, AC Adaptor, parallel port cable and in the
original box (opened). $145

* AMD K6-2-500 CPU and Soltek Super Socket 7 Motherboard, comes with all
motherboard manuals, drivers and in the original box (opened). $180

* AT Case and power supply - Suites above CPU/MB Combo, Mid Tower
construction, works fine. $10 (Pickup only)

* 1xAtari STE Computer and 1xAtari STFM Computer, includes games powerpack,
utilities, manuals, 25 blank disks,
1xMonochrome Monitor (they also plug into a Colour TV), 2 Mice, 1
Joystick. Would suit musician or gamer/collector. $145 (Pickup Only)

* Boston Accoustic BA375 Speakers (2 Satellites and 1 Sub) - only has a
digital input so they must be used with a soundcard that has a digital out,
boxed but opened - $50

* 14" KTX Monitor - includes manual. $20 (Pickup only)

* Vibra16 (Fully SoundBlaster16 Compatible) Sound card, Includes original
manual - $20

* SN3200 PCI Combo Network Card - Has bothe RJ-45 and BNC Connectors,
operates at 10Mbs or half-duplex only. $5

* GIVEAWAY!!! - Free AT CASE (Pickup Only)

NOTE:
With all these items I would prefer buyers to pay cash and pickup from
Brisbane, but will COD (at the buyers expense) except where specified as
pickup only

Please respond by emailing a.nielson@NOSPAMmailbox.gu.edu.au (REMOVE
NOSPAM)

From: jba4@nospam.po.cwru.edu
Message-ID: <3d192654.2612326@nntp.clvhoh.adelphia.net>
Source record: 33919

Hey everyone! Just wanted to let you all know that the TT was crashing due to a failing power supply. I was able to replace the TT power supply with a full size AT power supply rated at 250W. Since the new power supply doesn't fit in the system, it simply sits beside it with wires running through the now unused TT power socket. It powers the TT and its internal drives and also a new fan mounted where the old TT fan was.

The TT is now up and running as my main network server. I have it connected to my cable modem through a router and everything seems fine. Thanks for all the help!

Hi Lyndon,
I have an AT Speed C16 manual. I could scan it, but that would be a lot of images. Where in the world are you? Maybe I could mail you copies of the appropriate pages. Or if there is a specific part of the install you're not sure of I might be able to just answer that from the manual.

Could someone detail the parts list required to get an IDE drive running on a Falcon that did not come with a HD inside? My SyJet is getting a bit flaky, and my dedicated HD is only 230 Mb.

I suspect I will need a 2.5" drive, a cable of some kind, and a mounting bracket of some kind. Are these standard issue, or Atari specific? Do I need anything else? Does connecting an IDE drive interfere with the SCSI bus?

Since STe computers haven't been made in a decade or so, I'd keep an
eye on Ebay Australia. For the SCSI adapter,
http://www.atari-workshop.co.uk/products/host_adaptors.htm is a good
place to start.

I believe that NVDI up to version 4 was hardware specific. I know for
a fact that there is a NVDI4 for the ET4000. With NVDI5, all drivers
were included.

Pretty much all of it I don't really understand. Do you have
drivers too? It's the section on actually installing software,
I've installed hardware no problems. Had to rise the board with
a chip socket to clear the MMU chip.

Hmmm... sounds like PSU weakness :-(I'm experiencing same thing
with a TT-RAM card : works fine with 4MB, but randomly crashes
with 16 MB :-(
What about trying with an old (i.e. not an ATX) PC PSU, after
swapping wires so as to match the TT's one - but check with a
voltmeter, for some wires are different from TT's to PC's PSU :
usually, PC's yellow matches with TT's blue :-(and your TT would
not appreciate at all :-(:-(:-(

I have now installed NVDI 5 again, selected NOVA Graphic card option
and it seem to work (NVDI gives GDOS scalable fonts, and NOVA VDI
works as VDI). But the problem is that the card is unstable. Whole
system hangs very often. I realised that it does not hang when I use
only EMULATOR.PRG from NOVA, but that gives 640x400 mono :-(
So maybe it is software bug, not hardware. I have NOVA drivers 2.12
version. I tried NOVA 2.67, but they don't work with that graphic
card (I would say they do not work at all...)

I don't have PC PSU, but I tried connecting the internal hard drive
to another PSU from and external CD-ROM drive (hope this reduced
the original TT PSU load?) but the problems remained... ;-(((

576. GodPey - HELP!!

Newsgroup: comp.sys.atari.st
Date: 2002-06-26 12:55:30 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3d19b9bd$0$29610$4c56ba96@master.news.zetnet.net>
Source record: 33935

Hi all!

I've been playing Reservoir Gods' excellent new game GodPey - see http://www.reservoir-gods.com - their new website.

It has numerous modes and play styles, but I'm getting frustrated with Puzzle mode.

I can complete the first nine levels fine, I understand that if I have only two pieces in a column I can, by swapping them, use them as an on/off switch - set the switch off, line up all the other columns to make up lines and then set the switch on to complete the level.

However this strategy falls apart when each column has three pieces in each, I can only swap two so three can't act as a switch. I thought that perhaps I can have a loop at the side to use up a third piece and the other two in that column to be a switch, but I can't visualise how this could work.

I know it must be possible - so many people are on the website highscore table above level 11.

(incidentally there is a bug that whatever level you reach, the highscore enters the level above, ie I can reach level 10, but can't complete it, but the highscore registers as 11)

Can some kind soul help or just give a hint please? :)

Cheers!

James

I think he meant how the Falcon will get an IP from the router. If that's the case, disable DHCP on the router and assign an IP for each computer. Simple as that.

Joshua.

You are aware that you need to install nvdi from a clean system?
Meaning if you had NVDI already on there you might want to remove it.
It has an ET4000 install option when first installed.

Also, when combined with the Nova drivers you might have to disable the
screen DRV*.SYS files. On my TT when I had an ET4000 card, this was the
case. I don't have the Nova ET4000 anymore though so my memory is fading.

Depending on the Nova driver version some have additional options
in a seperate file. One option directly effects how the mouse is
handled. For example if it is freezing while you drag windows and
such it might be this. I am headed to work, but I will see if I
still have this info on my hard drive when I get home later.
I'll get back to you...

2.67 is for NOVA ATI mach cards.

I happen to have such a card in my TT. It runs a 17" TFT panel @ 1280*1024*256.

I am a very happy guy. :-)

Date: Sun, 23 Jun 2002 13:13:42 -0500

Hi Frederic,

>yeah thanks.
>Next time try to understand, instead of being the csast referee.

Understand?
What I've understood from your contributions to this thread is that you regard *all* non-MiNT Atari users as Mr. clueless Joe average, who uses his computer once a week, and doesn't even know how to cut and paste... Sure... of course this was irony at his very best, but like usual, you don't reply to posts who oppose your views... so your statement still stands.
You not only insult me, but *EVERY* SingleTOS and MagiC user, anyone who doesn't share your views is put in the category "dumb ass", and then you are surprised that I react to this?

Instead of me categorizing MiNT users as well, let's for once turn this meaningless thread into an informative one.... Could you please tell me (us) what MiNT has done so far for this platform, why we should all use it, what the advantages of using it are, and what in your humble opinion the future holds for MiNT?
But please, don't reply with the usual meaningless hyped drivel, I don't want to read another post driving me up the wall, give us a posting full with pro's and contra's and convince us... if your arguments are really good and you succeed in converting us, then you'll actually turn minimum thousands of morons into normal living beings like yourself...
Go for it Frederic !!!

>Actually I don't expect you to understand at all, so that does not
>surprise me.

No, of course not...
How could I possibly understand it? May I remind you that I belong to that gang of dummies who use SingleTOS and MagiC...

>Have a good day, and tell me where I can pickup this prize.

Hohoho, you haven't won yet...
You're only nominated. But unless someone comes forward who succeeds in topping your nonsense, you'll probably be the winner.

Oh did I mention what the prize is? ;-)

Cheers from Belgium
Dennis

Does the TT have a blitter, i forgot, if it does can you try switching it
off, otherwise I'd cast stony glances at your power supply.

Hi Uwe!

On 25 Jun 2002 08:32:15 , Uwe Seimet wrote:

>The Falcon has one IDE port, which supports two IDE/ATAPI devices. With
>an adapter you can use 3.5" drives.

I have a 3.5" IDE HD internally in my recased Falcon. I see you say the
port supports two devices, so (theoretically) I could also have a modern
CD Rom drive also in there?

If this could be done, would Extendos Gold or similar support IDE CD Rom
drives?

Cheers!

James

I have 5 Gateway solo laptops 2500 series

Spec:
Celeron 300 up to pII 400
6gb hard drive
up to 96mb ram
cd rom
floppy
2 type 2 pc card slots
composite video out
800x600 active tft color screen
power supply
docking station w/3com 10/100 nic

Looking to trade for Stacey, Falcon, TT, Mega STE and 1040 STE

If someone has a Jaguar catbox they would let go, I will trade all 5.

email me @ rdf0013@earthlink.net or leave message in group.

All you need is a Falcon internal IDE HD kit that you can get at Best Electronics or B&C Computervisions. It comes with the internal hard drive bracket and miniIDE cable to connect a 2.5" IDE HD to the Falcon. Just plug and play. They're dirt cheap - only US$15. (I hope you're not going to complain about that price!)

Personally, I say just stick with a 2.5" HD. The smaller models aren't that expensive.

Tried that, but it didn't work at all (black screen when rebooting).
Then I used "NOVA-Grafikkarte" option in the installation program,
and installed it together with NOVA 2.12 drivers. Now it "works" with
NVDI (I'm impressed by the speed and image quality, Papillon 3.04
works great) but it hangs quite often.

Try a little program called "Gem Explorer" for your PC. It allows
a PC to read Atari formats. It worked on one of my Atari SCSI
drives, but could only see the first partition. The program is
made by the same people as "Gemulator", I think. It's free, and
quite small. Not sure where I found it now.

Hope it works for you,

The card hangs only while moving big blocks of image (real time
window dragging or scrolling the window contents in real time, not
only with mouse but also using the Shift+arrow keys) - but not always,
it does *not* happen when I do it slowly. Also it does *not* hang when
I leave it on for some time or when I just move the mouse cursor around.

It also *never* hanged (yet?) while performing VDI tests using zBench
or Kronos. But it can be very easily hanged just by fast scrolling
a desktop window in a real time, or by pressing Shift+UP/DOWN
keys in Papillon displaying a bigger picture. In any resolution
and in any color depth.

Is that something wrong with the software, with the VME-ISA adapter
or with the card itself?

A scsi adaptor, like link & link 2, shouldn't cost that much to be
posted to you as they are relatively light.

> Who sells these machines now?

No new Falcons, I sell refurbed.

> and what form do they come in?

How long is a piece of string, what do you want?

Currently I have C-Lab and Mk X in stock.

Also a few mobos, an empty Mk X case, FDI and CAC.

> Prices

Depends on spec. I don't give 'em away......

> And what about things like Cubase, is that still supported and for sale?

Cubase for the ST needs no support, it works. I sell used V3 and Audio.

Barrie at Keychange. www.keychange.co.uk.

Grzegorz,
Are you using MAGIC with Jinnee 2.5 on this TT????
I had the same problem with my Falcon when I installed
my Eclipse with an 4 meg ATI GC!!!!! Inside of
Jinnee go to SPECIAL, SETTINGS then DRAGGING. Inside
of DRAGGING towards the top there is 2 things that
say DRAG TEXT IN REAL-TIME AND DRAG ICONS IN REAL-
TIME. With those checked it will cause our GC's to
hang on us for some reason!!!! See if that helps for
you!!!! Let me know how you come out!!!

Thanks,
Carey Christenson

Grzegorz,
I forgot to add with the previous post that if the
graphic card is not have a good soldered connection
from the power supply that it will give you various
problems as well. I dont believe that your power
supply is bad. If it turns the computer ON and
functions just fine without the GC adding the GC will
NOT put that much of a load on the PS!!!!! Guarantee
that. Problems I had with my soldered connection to
the power supply gave these results!!!! Computer
locking up on bootup, moving icons around very fast on
the screen locked up the computer as well as moving
windows did the same thing!!!!! Basically anytime the
GC had to work to compute and show items on the screen
it would hang because it could not draw enough from
the poor connection. Check this out and let me know
if anything helped. Oh, and BTW anyone who thinks
that a poor connection would not cause these results
and jump to the conclusion that I had something
installed incorrectly might want to reconsider. I am
an electrical engineer and am by NO means a MORON. So
think before you respond!!!

Thanks,
Carey Christenson

Hi, I'm Ben Smith of Bravo Sierra Computers. A reseller of Used and New Atari 8 Bit & ST Computer Lines as well as Atari Jaguar Game systems! I'm announcing a Contest! Whoever can write the best Submission for the "Why you should buy Atari from Bravo Sierra Contest!" My Customers are living examples of why to buy from Bravo Sierra! More satisfied Customers & the number keeps growing! Submissions judged on persuasiveness. Originality would be nice but not required. Personal testimonials preferred! Please include your real name (No aliases without your real name!) and where your from. Please submit your entry by Thursday, August 15th. Contest will last 6 weeks, but could last longer should I deem necessary. Prize for the most persuasive entry Wins $25 U.S. Dollars in Cash or Money Order. Entries can come from any Country! All entries become the property of Bravo Sierra Computers! Please E-Mail all entries to atari@aracnet.com plus results will be shown at the HotLink Below!

http://www.aracnet.com/~atari/whybuyben.htm Contest WebPage

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@aracnet.com. If you can't reach me at benjamin.net see my E-Mail/Web/Phone info in my Signature at the Bottom!

Bravo Sierra Computers has moved to a new Internet Provider atari@aracnet.com Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on the web at http://www.aracnet.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@aracnet.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

614. TextView and AtarIRC

Newsgroup: comp.sys.atari.st
Date: 2002-06-28 02:54:36 UTC
From: lp <gfa@basic.net>
Message-ID: <B941482C.77FD%gfa@basic.net>
Source record: 33824

Hi,

For those of you that use aIRC, the number one feature request is always a scrollback buffer. In case some have not read the docs, you can use STeno as a full session buffer with aIRC. Not just a mere 200 or so lines, but an entire session and you can edit it, save it, print it, or whatever. With todays multitasking setups, larger memory models, and such I really do not want to re-invent what STeno can already do. I also prefer the modular approach. The main problem is that STeno is not free, it's commercial. That's not a bad thing mind you but most people don't have it, or don't wish to buy it just for that purpose. Although I must say I bought STeno, and I love it.

Well I would like to see TextView coded by AssemSoft Productions tweaked to support the same AES msg's used by STeno for text capturing. The author seems to think this would be do-able. TextView is already a rather speedy text viewer. Check it out at: http://assemsoft.atari.org/#ss

If you'd like to see TextView work with aIRC as a full scrollback buffer please take a moment to send Odd Skancke an e-mail! Show your support. ;o) Thanks for your time...

From: Ken Kosut <kjcat@shell.voyager.net>
Message-ID: <3d1bea8f$0$1433$1dc6e903@news.corecomm.net>
Source record: 33826

Hello,

Does anyone know how to convert a MIDI file to .AIF, .AVR or .WAV
format.
What additional software/hardware is needed?

The goal is to burn a MIDI file to CD.
Strictly Atari Platform - Hopefully using CDWriter Suite.

Cost is a factor.

Thank you very much in advance.

ken

I'm sorry. This is just a little too self-serving for my tastes. Between
this and the auction page, my respect dwindles rapidly.

Ken,

In order to do this you need some sort of program to do it. I know there was a software package out for Atari that would do this.

In order to figure out what you need you should understand what is going on. A midi file is basically like a music script. It is a piece of a puzzle to reproduce it. In order to reproduce it you'll need samples, and a soft/hard synthesizer.

One approach can be to play the midi file -> sound canvas or other sound module -> record the resulting sound.

another method is TiMidity++ for linux which is a "midi converter" this will basically play the "script" out to a set of samples that you have defined to reproduce the song.

Any of these types of programs though need a set of samples to work with. You can use the piano samples from a Yamaha Clavinova or a Roland Grand Piano, etc, so forth and so on. So it's like personal preference. I am pretty sure Gravis Ultrasound sample packs are pretty easy to find (and what you are supposed to use with Timidity. Timidity is for linux. When it comes to Windows software or that particular software package for atari, I'm not sure ;)

Hope this helps out

Try a little program called "Gem Explorer" for your PC. It allows
a PC to read Atari formats. It worked on one of my Atari SCSI
drives, but could only see the first partition. The program is
made by the same people as "Gemulator", I think. It's free, and
quite small. Not sure where I found it now.

Hope it works for you,

If you're really supporting multi-tasking setups, why not consider allowing
aIRC to also run with the appropriate STiK/STinG gateway under IConnect or
the Magxnet IConnect equivalent?

I probably haven't phrased that too well, but you probably understand... I've
mentioned it before.

Cheers

Derryck

Ben didn't write the message you quoted.

The message you responded to was cowardly attempt to dump on Ben. Maybe my comment is a bit harsh, lets just say the individual was having a monthly pms attack.

Did anyone ever try encorporating a TT or Medusa etc into a PC-style
chasis and hooking up 3D cards or whatever? Would be an interesting
machine...

I've never used this hook-up, but have heard its supposed to work.
Connect the Atari modem to the PC modem (with a phone wire) open a
terminal prg in the Atari and the PC and D/L your files to the PC..

Maybe someone who has tried this will give us some more details, as I
will need to do some file transfers before long myself.

Regards, Donner.....

Any math-intensive operations will benefit from the MC68882 Math
co-processor. But otherwise, you should see little, if any, difference in
overall operation.

Hi all!

NAS 2002 is now On-Line and you can meet all of us at #atarinas IRCnet.
I will attend tomorrow (saturday) and start up two webcams and fill my homepage
with a plenthora of pictures this NAS weekend.

Most of us from The Swedish Atari Users Association board will arrive tomorrow,
but there already some folks att NAS. Erik Hï¿½ll, Kenneth Medin, Nick Harlow to
mention a few known.

From my homepage you can participate with additional info have to get in touch or
whatch all the pictures taken.

My Hades060 is in a PC style case, however unless there are drivers for 3D cards it's mostly pointless. I do not have the skill to code drivers or I'd of done it some time ago. ;-)

Hi Ken... I know I somewhat answered your Q on the Notator list (
http://www.notator.org)but my suggestion is to record your MIDI parts
to cassette tape (I do this all the time)and then you will need to
find an application for your Falcon that records and saves as WAVE,
AIF or AVR which is what CDW needs to make a CD from.Then simply
record the cassette mix to your falcon.

Anyone know of an Audio recorder for Falcon that saves as WAVE, AIF or
AVR ???

IFusion does not follow the STiK v1.0 API. All attempts to reach the
author failed and I am not the only person who could not reach him.
Therefore it's not my problem. I also have none of the software
here to test with and since aIRC is 100% FREE it's not a priority of mine.

> if anything helped.

Thanx for your suggestions. I have checked the connections
of the card (both ISA and VME) and the connection of the power
supply to the mainboard (they seem OK). But it still crashes. :-(

What I observed: when the crash occurs (before the crash to be
exact) several gray, white or black lines appear on the screen at
random positions (1 pixel of height and 3 pixels of width).
They are not 8 pixels wide, just 3. The same white lines also appear
and disappear while loading something from hard drive. When the
loading is finished, they disappear from the screen. Is it normal?

Another weird thing is that it never crashed when pmDoom is running,
although it certainly transfers a lot of data to the card.

Maybe (just *maybe*, I didn't tested it for a longer time)
removing the TT-RAM card seem to help, or at least those crashes
appeared less frequently.

I can't even start Jinnee 2.5, it causes 68k-exception error.
I can only work with Thing (MiNT/n.aes) or MagXDesk (MagiC)
with the card. I assume my NOVA drivers (2.12) are too old,
because Jinnee works with NOVA 2.67 - but then, NOVA 2.67
does not work with this card... :-((

Someone should. I'm no coder either, but I bet it'd make a damn fine
machine if they would. Only trouble is then the software, it'd take a
long while to port/write any decent games or software to take
advantage. Still, something to do on yer days off...

I would like to suggest that PIXART.RSC file be corrected slightly, adjusting the number of blanks behind menu items, so that any assigned keyboard shortcuts would appear right-justified in the menus (e.g. try assigning some keyboard shortcuts to Cut, Copy and Paste and see where they appear in the menus)

From: "Grzegorz Pawlik" <atarirulez@go2.pl>
Date: Thu, 27 Jun 2002 09:56:28 +0100 (BST)

Hi Grzegorz,

>Tried that, but it didn't work at all (black screen when rebooting).
>Then I used "NOVA-Grafikkarte" option in the installation program,
>and installed it together with NOVA 2.12 drivers. Now it "works" with
>NVDI (I'm impressed by the speed and image quality, Papillon 3.04
>works great) but it hangs quite often.

I've never seen the Nova interface for the ET-4000, so this is a long
shot...

1. Remove the interface from the TT and see if there isn't a jumper on it
labeled TT/MegaSTE.... that jumper is present on the Nova VME interface
for the MACH 32 and 64 cards... when the jumper is set to "MegaSTE" I used
to get, more or less the same phenomenae...

2. Are you sure the graphic card is the original one? If not you may have
to change the GAL chip on the VME interface, IIRC Nova had three different
GAL's for the ET-4000 cards.

Cheers from Belgium
Dennis

Source record: 33855

Hi,

Gosh, I wonder why we have so few Atari resellers left.
Bravo Sierra may be expensive etc, but you still have the option to go
elsewhere, or dig up something yourself.
Be creative instead. Talk to the guy. Make a difference.

/Peter Persson

Hi,

> Any math-intensive operations will benefit from the MC68882 Math
> co-processor. But otherwise, you should see little, if any, difference in
> overall operation.

Allmost. Math intensive programs that are designed to take advantage of a
match co processor will benefit from it.

Comparison: Audio stuff don't automatically sound better just because you
happen to have a Falcon with a DSP and 16 bit sound capability, right?

I have an FPU. Most stuff don't use it. Some demos and raytracing stuff
requires it however.

Regards

/Peter

>Connect the Atari modem to the PC modem (with a phone wire)

Unfortunately, in this particular case it is not a practical approach.
Note the words "a couple of gigs worth". With a transfer rate of a couple
of kilobytes/second through the serial line (modem), it would take a
considerable number of days to transfer all those files.

Updates since June 6, 2002 include:

* Review of Starflight for the Atari ST.
* Review of Awesome Golf for Lynx.
* Review of Pac-Man for the 2600.
* Review of Starmaster for the 2600.
* What's wrong with 2600 Pac-Man anyway?
* New TAT Poll: How many Atari games do you own?
* New 2600 review form for including scores to the 2600 list! Let's build up the 2600 Review List!

Be sure to check out the new review page format too!

These are not rare by any means, I can get them from any of 4 dozen local
suppliers for 50 to 75 cents each.

The interface has a writing "VME TO IBM" on it, no manufacturer or
anything else is stated. The card has ET4000AX graphic chip on it
(Tseng TC6100AF to be exact). Together with it I got NOVA 2.12 drivers.

> 1. Remove the interface from the TT and see if there isn't a jumper on it

There are no jumpers on my ISA/VME interface :-(

> 2. Are you sure the graphic card is the original one? If not you may have
> to change the GAL chip on the VME interface, IIRC Nova had three different
> GAL's for the ET-4000 cards.

I don't know if it's the original one. How can I check for which type of
card the GAL chip is for? What card would work well with this interface?

BTW in 32k color modes no icons are displayed, why? There are just
black squares instead of them... :-(
And (in all modes) the vector fonts are smaller, I have to change 10pt to
14pt in CAB to get a readable text. In Papyrus it's the same, text is
displayed smaller than is printed out... No more WYSIWYG :-((

Hi All,
I use Cubase on a Falcon to record the audio from a mixing board fed
by a MegaST4 running an older sequencer program (Midisoft) which plays
MIDI files and sounds out of several modules. Then convert the Cubase AIF
to WAV with 525. Then CDwriter to record the WAV on CD. Whew!

>
> Comparison: Audio stuff don't automatically sound better just because you
> happen to have a Falcon with a DSP and 16 bit sound capability, right?

You need a different comparison. Audio stuff most definately does
sound better on a falcon with DSP & 16 bit sound, at least compared to
ST's - TT's. My audio also sounded better when I got a FAD from Line
Audio with 18 bit converters.

An interesting thing - I had to send my CT2B Falcon to Mr. Cuzba in
France to fix my lousy installation. I was not aware that my Falcon
had an FPU at all. It was apparently disconnected, and he reconnected
it for me. Good thing too, because I wanted to make mp3's with
Aniplayer, and it requires an FPU for that.

The main thing is that a program will only benifit from an FPU if the
code was written to use it, otherwise you won't notice a difference.
Wayne.

660. Elite/Elite II wanted - Very good price paid

Newsgroup: comp.sys.atari.st

Must be in original box contain all manuals + overlays/poster and as mint as possible. All versions wanted. Also Elite on any other computer/console formats.

Will pay VERY good price for perfect/near perfect examples. Please email me if you have anything.

Dave.

>
>/Peter Persson

Hi All

Yup there maybe few of us Atari resellers, I prefer to be called
supporters, but Ben's postings are rather tedious and repetitive.

If Ben's also saying he never uses auctions, I find that hard to
believe. I admit it I buy from auctions and got some lovely rare stuff
to add to my collection. E.g. a Lynex 16-bit stereo sampler rack unit
that connects via an interface to the Atari cartridge port (not tried it
on a Falcon yet).

I should be back up and running soon:)) at last:P

Just to elaborate, Atari joystick connectors are standard 9-pin "D"
connectors that are physically identical to 9-pin RS-232 serial port
connectors as used on x86 computers.

663. Falcon030 wanted

Newsgroup: comp.sys.atari.st
Date: 2002-06-30 18:36:54 UTC
From: Chris <capw@rogers.com>
Message-ID: <3D1F4FF7.3B644F13@rogers.com>
Source record: 33874

Hi,

Does anyone have an Atari Falcon030 for SALE??

MUST be in working condition. i.e.: powers-up fine and works for hours on end.
Preferred w/14 megs of RAM.

Internal hard drive would be nice but not necessarily needed. Don't care for the mouse as I got plenty of them here at home.
Monitor adapter would be nice too.

Please name your price and am hoping you are flexible in negotiate for Best Offer. As I am on a budget.

I live in Toronto, Ontario. Canada (eh). Would prefer to buy in Canada with Canadian funds. Or from the U.S at a REASONABLE cost in U.S funds or Canadian funds.

Please e-mail me directly at capw@rogers.com (mailto:capw@rogers.com)

Thanks,
g'day

I think you omitted "Over Frequent". Once a month fine, but these days they seem like a weekly event, and they are really tedious. I also think that the other people who have a pecuniary interest in Ataris and who frequent this list (and there are a few) seem to be "real" Atari enthusiasts. They contribute to the list. They interact with every one on here, and they also take the odd ribbing and leg pulling in the spirit in which it was intended. What they don't do is post a monotonous item at short intervals that says "come and look at my Web site but guess what its not changged much since last week"..

I have not bought Atari stuff from Auctions. I understand they can be problems, but the same goes for dealers as well.... I have bought things offered on the list and so far am reasonably happy. Its arrived in good order and on time..

OK...did some searching and found this:

http://gbarges.free.fr/quincy_e.html

QUINCY

It's shareware...you can download it. The shareware price is only
40.00, which seems very reasonable.Great looking interface. You can
even import MIDI files and synconise Audio with it!It saves as AIF
format. As someone else mentioned, you can convert it using a utility
called 525, however if CD writer accepts AIF format you are set. I
think this is your solution. I am going to try the program myself!

Tim

666. XaAES v0.950

Newsgroup: comp.sys.atari.st
Date: 2002-06-30 20:06:00 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3D1F6481.1748B10E@chello.nl>
Source record: 33876

LS

There is a new version available on my homepage.

Done:

1
open_window()
Removed any adaptation of the coordinates of a window when it is opened.
(Giving apps the opportunity to open ghost windows (for whatever reason).

2
Reorganization of options database. Make it more work as the syntax suggests.
Any groupimg of options and program names is allowed.

Options specifications always add up per specified program.

3
The file xa_exec.scl is now executed by a separate program xa_scl.prg
This is done completely automatic. just make sure the program is in the
same folder as XaAES.
The program is started after the XaAES is fully started, making the
setup procedure run much smoother.

4
A log of XaAES booting up is written to xa_setup.log
A log of what xa_scl.prg does is written to xa_scl.log

5
Implemented boolean variable type 'bool':
boolean value denotations are 'true' and 'false'.
Any other type is coerced to one of these.
int: not zero yields true,
string: not empty yields true.
undefined yields false.

Simple if statement implemented.
In the setup the statement is restricted to 1 bool and there is no nesting.
No expressions.

Same restriction for xa_scl. But that will change in the future.

The simple if statement is mainly implemented to make it easier to have
different versions of your setup in a single file without the excessive and
cumbersome use of commenting by '#'.

See the example xa_exec.scl included.

6
The run command in xa_exec.scl can have wildcards.
All matching names in the directory are launched.

Sort of autogem function.
Thanks Martin Tarenskeen and Patrick Prokopovitch for the idees.

The explode program has thus moved to a folder named 'autogem' that has become
part of the distribution.

7
Fixed the 3 pixel gap that sometimes occur when a dialogue is windowed
by XaAES.

9
Implemented the easiest (and rather effective) redraw optimization:
'engulfing' queued redraw message are amalgamated.

10
Fixed transparency of text objects with 3d effects set.

10
Restrictions on the XaAES function of putting dialogues in windows.

No window is created:
1 If the application does not call form_do at all.
2 The application already locked the screen (wind_update()) beforehand.

In both cases XaAES behaves as all the other AES's.

Because many applications rely on the fact that all AES's restore a form_alert
background, this is done by XaAES as well now, be it only when the app has
locked the screen.
There might be something on the screen underneath the alert
that is not a window.

This might fix problems with programs that do wild things on the screen.

Have fun!

Hi Tim,
I don't see how that program can save a MIDI file as AIF ! The audio
part, yes, but how MIDI? Also, a note about CD writing, my Yamaha manual
states it "prefers" WAV files when writing an audio CD to be played on
standard CD players.
Later,
John G.

You can count yourself lucky if you have a Falcon that can work
for hours when doing DMA intensive work. I've never got mine
faultless, tried all sorts. Still, is a lot better than it was,
plays MP3 for about an hour or so before it hangs.

I'm trying Quincy myself, and the english (short) manual is not adequate
for me to learn the program. It sure would be nice if someone would
translate the french (full) manual :-)

I am having trouble understanding all the aspects of mixing down and
editing, and saving to a stereo file. I've also had trouble with the
disk not tracking, even though I have followed all the suggestions in
the troubleshooting section of the manual. Sure looks like a great
program though, and inexpensive.

You can easily transfer huge amounts of data using a hard disk. With
MiNT or MagiC and/or HDDRIVER you can use PC-compatible partitions with
the Atari.

>author failed and I am not the only person who could not reach him.

Yes, that's fair enough :-)

But is there a way that you could get aIRC to work when Vassilis' Magxnet IConnect gateway happens to be loaded alongside his GlueSTiK port? At the moment one has to disable the IConnect gateway. I dare say that the removal of the check that I guess you make for the presence of IConnect would do it.

>Therefore it's not my problem. I also have none of the software
>here to test with and since aIRC is 100% FREE it's not a priority of mine.

At the very least may I respectfully suggest that aIRC exit gracefully if the environment is not to its liking?

Cheers

I used it for years, never saw big bugs, the only (little) one was the fact
that the desktop did not redraw correclty sometimes, but pressing the 'Clr
Home' key fixed it anyway...

Hi Djordje!

If you look at the RSC in Interface, you will see that it has the
spaces after the menu items. For instance, all items in the Edit
menu are 22 characters long overall. Unfortunately the program
seems to ignore these when you assign shortcuts to them :-(

684. Falcon030 with newer IDE Hard drives?

Newsgroup: comp.sys.atari.st
Date: 2002-07-02 02:05:36 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1025550410-290830AEicMi@williams-net.com>
Source record: 33892

Anyone,
I have a Falcon030 about the end of February I went
out and bought a 40 GB 7200 RPM IDE Maxtor Hard drive.
I am still using my 84 meg stock Falcon IDE hard drive
as the Boot-up partition. I forgot to mention the
part number MX6L040J2, this is Maxtor's own part
number that I found on there web-site. My question is
this, I have the stock IDE 84 meg hard drive first
inline on the ribbon cable then the Maxtor 40 GB is
last or second on the chain. When I first boot-up the
Maxtor spins up but is not recognized by my HD
software. Once I get to the XBOOT screen I can power
down and reboot and it is recognized and all is well.
I forgot to mention that if I would have continued on
after the XBOOT screen on the first boot-up that NONE
of the partitions would be seen by my OS!!! OK, now
that is one way of booting up, the other and this is
really wierd, is to power up the 40 GB Maxtor (It is
hooked to my PC tower which houses my SCSI CD-Rom and
CD-Burner I also turn the power on in the first method
as well.) Then UNHOOK the 40 pin ribbon cable the
hard drive begins to spin up and then plug it back in.
It is recognized and all is well. It is my
understanding that there maybe a spin up jumper on the
hard drive after going to the web-site. I failed to
turn up anything. Any suggestions are welcomed. I am
thinking of calling Maxtor and finding out if there is
such a jumper in the meantime I am open to
suggestions.

Thanks to all,

Carey Christenson

I had a similar problem with my Hades060 and a brand new
Maxtor IDE drive. I could do weird things like plug the drive
into the 40pin cable after it spun up, then the machine would see it.
However, no combination of jumpers or drive arrangements would
make it boot like it was suppose to. In the end Fredi at
Medusa Systems told me not to use newer Maxtor drives. Due to
the language barrier I am not sure exactly why, only that
he said he tested one and found it to be non-standard,
or rather not backward compatible to EIDE I assume. Needless to say
I bought a Quantum as he suggested and it took right
off, bought another one a bit newer and it works great
too. I eventually re-sold the Maxtor to a PC user and

it worked fine, so the Maxtor driver certainly had issues
with the Hades EIDE bus. I don't know if this info is helpful
but I thought I'd share it. I know I was sweating bullets
over it at the time.

I just received a copy of BlowUP030 (software only) for my Falcon. I was sure that it would not work
with MagiC/NVDI, but I am trying it, and so far no problems but typing is slowed down a bit. Should I
expect some problems? Is there a better way to get higher screen resolutions without hardware?

Hmm, well it beats my 233 MMX laptop. It only just plays MP3s.
I think it needs more than 32MB of RAM but considering the
Falcon is about 8 years older technology, it ain't bad :)

Sounds like memory access errors, but could of course also be due to
accesses to bad locations on the card.

>They are not 8 pixels wide, just 3. The same white lines also appear
>and disappear while loading something from hard drive. When the

Hmm. Interference (insufficient shielding) might perhaps cause something
like that. Possibly also insufficient power-supply, as was suggested
earlier.

>loading is finished, they disappear from the screen. Is it normal?

Shouldn't be.

> ...thing is that it never crashed when pmDoom is running,
>although it certainly transfers a lot of data to the card.

Transfers to the card are not likely to be a problem, as they are quite
slow. Things are very different when the card itself is moving a lot of
data around, as is the case with the scrolling and window moving you
have mentioned as causes for hangs.

>Maybe (just *maybe*, I didn't tested it for a longer time)
>removing the TT-RAM card seem to help, or at least those crashes
>appeared less frequently.

That would point to a power-supply problem, IMO.

That mode also puts a lot less stress on the card, so it does not really
say much about whether the problem is hardware or software related.

You are using the standard desktop, right?

The TT desktop has no knowledge of anything besides mapped colour modes.
So, it has no choice but to try to use the same method to draw icons
in a true colour mode as it always does. However, as you have found out,
this does not work.

The exact same thing happens if you try to use a 23/32 bit mode with
the standard desktop on a Falcon. The Falcon obviously knows about 16
bit true colour mode, and handles that fine, but it thinks anything else
than 16 bit must be a mapped colour mode...

A modern third party desktop would know about these things and display
the icons correctly.

>And (in all modes) the vector fonts are smaller, I have to change 10pt to

Since vector fonts always need to be scaled, they have to rely on some
kind of information about the pixel size. It might be that the NOVA
VDI provides different values from what you might expect.
It is not unlikely that the people who wrote the NOVA VDI did something
similar to what I did in fVDI and provided a way to set these values
in a configuration file.

Djordje is right Peter, if you add spaces to those menu items to pad them out to be the same width as the German version (viz 27 characters overall in this case), added shortcuts are then correctly aligned. I think that's acceptable behaviour.

I'll do the honours if you like.

Djordje, are there any other instances of this aside from the main menu?

Cheers

Derryck

If it had not been for the fact that you get this problem even when
scrolling using the keyboard, an interrupt problem might have been the
cause (assuming the NOVA/ET4000 uses the hardware mouse cursor of the
ET4000 card).

The only remaining causes I can think of are power-supply issues and
overheating of the ET4000 chip.
You might want to try putting a heatsink on the chip.

>It also *never* hanged (yet?) while performing VDI tests using zBench
>or Kronos. But it can be very easily hanged just by fast scrolling

That does seem a bit strange. IIRC, zBench does not do any actual
screen to screen blits, but I'm pretty sure Kronos does.
Sounds strange that there should be a difference compared to manual
scrolling. Have you tried moving the mouse around while running those
programs?

You might want to try my VDIbench too. Aside from testing some other
(more interesting ;-) things, it also does not attempt to give any
kind of silly 'average performance' number. :-)
Unfortunately, I don't seem to have put it up on my Web page
(http://217.215.149.49), but I'll do that shortly.

>Is that something wrong with the software, with the VME-ISA adapter

Does not seem like it to me.

>or with the card itself?

My bet would be on that or the power-supply.

Just moved house and have had a big clear out of lots of my old junk.
I'm sad to see my atari ST stuff go, but I just don't think I'll make any
use of it any more.

I'm in sevenoaks in Kent - just off M25/M26

Atari STE - 4MB
Two A4 paper boxes filled with ST Format, Atari User and ST World magazines.
There are many issues of these, going way back - I haven't the time to
catalogue them right now.

SM124 mono monitor.

External DD floppy - with blitz turbo copier widget built in.

Most original manuals, and a few books like STOS, ST BASIC etc.

Tons of ST Format and Atari User coverdisks.
A smattering of original games and apps - (not many).
Hundreds of menudisks - automation, pompey pirates, medway boys etc.

Panasonic 360DPI 24pin dot matrix printer.

A couple of midi cables I'd used for networking between ST and falcon.

If anyone wants to pick this stuff up - let me know via email:

steve.rodgers@ts-associates.com

Even if that were the case, DCC would still be broken since the author
failed to reply, I offered to work with him to fix that. I'd rather it did
run at all than run crippled, it's rather annoying to get mails about a
broken feature you have no control over.

> At the very least may I respectfully suggest that aIRC exit gracefully if the

Been working on that. Hopefully, the next release will resolve all magxnet
issues. No release date available.

In fact the standard desktop displays icons correctly (they are
monochrome, as usual in TOS 3.06). Problem is with 3rd party desktops,
MagXDesk displays black squares instead of icons, Thing and Jinnee
cannot even start (Thing runs in 256 colors only and crashes in 15 bit
color modes, Jinnee does not work at all, even in monochrome).

BTW I have realised that no matter what color depth is used, MagiC
uses MFA16.SYS screen driver and NVDI uses OFF002.OSD (I believe
this is off-screen-bitmap driver). Why? There are MFA32K.SYS and similar
files, they are never used. Is that OK?

Yes, it is available in NOVA 2.55 and up. I have NOVA 2.12 (which does
not have this feature) and NOVA 2.67 (which does not work with my
graphic card at all). :-(((

Could anyone (please!) send me NOVA 2.55 or similar version (higher than
2.12 and lower than 2.60 because 2.60 and 2.67 does not work with my
card....)

Just a quick question.

I have an old 2meg Stacy (20meg HD, no battery, box or manuals). It worked about 4 years ago when I last used it.

The question is, is it worth anything?
I tried looking on Ebay, but couldn't find anything similar.

I don't want to throw it out if it's worth a few quid, but I don't want to waste time cleaning and mending it (if it's broken) if it's worth bugger all.

Cheers,
Potts.

Ah, yes. I forgot that the colour icons didn't appear until the Falcon.
Monochrome icons are indeed likely to work fine.

>MagXDesk displays black squares instead of icons, Thing and Jinnee

Now, that is a bit strange. Although I've found that third party
desktops tend to do strange things regarding icons.
For example, while Thing gets things right on my Eclipse/RageII when
it is started up, reloading the icons may turn them into monochrome...

Unfortunately, it's next to impossible to debug these kinds of things,
since the actual problem occurs long before the symptom. :-(

>cannot even start (Thing runs in 256 colors only and crashes in 15 bit
>color modes, Jinnee does not work at all, even in monochrome).

Sounds like you need a newer version of the NOVA VDI, although these
problems seem a bit on the extreme side even for a somewhat buggy VDI
implementation.

Anyway, I have a small utility that you can use to find out what your
VDI has to say regarding its graphics mode. I don't seem to have it
up on my Web site, but I'll try to fix that shortly.

>BTW I have realised that no matter what color depth is used, MagiC
>uses MFA16.SYS screen driver and NVDI uses OFF002.OSD (I believe
>this is off-screen-bitmap driver). Why? There are MFA32K.SYS and similar
>files, they are never used. Is that OK?

I have never done anything about any such drivers when using my
Eclipse/RageII and have not run into any trouble. I simply remove the

NVDI 'screen driver' that would have been used if the system had started up without fVDI (normally the monochrome one).

I do believe you are correct regarding the NVDI OFF* files, but since I've not run into any program that uses off-screen bitmaps (AFAIK), I don't know if I'd have any problem here. If anyone knows about such a program, I'd be interested in hearing about it so that I can test it with fVDI (in which off-screen bitmaps are currently non-working).

Regarding MagiC, I can only assume that it uses its driver files similarly to NVDI. I know nothing about them, but MagiC is supposed to work fine with an Eclipse/RageII without doing anything about them.

By the way, how did you find out what files NVDI and MagiC used?

706. YSEDITOR & JXEDITOR updates

Newsgroup: comp.sys.atari.st
Date: 2002-07-02 19:30:29 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0207022112280.97-100000@easymint>
Source record: 33766

Hi,

I was having some nntp problems with my provider, so it's possible that I have already posted this anouncement. If this is the case forgive me, but here it looks like my previous posting failed.

Ok, here I go again:

I have released new updates of the YSEDITOR series of Atari editor/librarian software for Yamaha 4-Op FM synths. New in these versions: Newly compiled with GfaBasic 3.6TT. After all these years I finally found an alternative for some routines that only worked with GfaBasic 3.5 :-) The Midi-receive functions seems to be a little improved, but for me the most important thing is that they now also run happily with my Falcon030/CT2b in turbomode. (Previous versions crashed). And yes, it still runs on my humble 1040 STf too.

The new versions of YSEDITOR PLUS, YSEDITOR V50, and YSEDITOR FB-01 can be downloaded from: http://yseditor.atari.org

My latest project, JXEDITOR, for Rolands JX-8P/JX-10/MKS-70 also has had several updates lately. Take a look at

http://www.home.zonnet.nl/jxeditor.htm

if you're interested.

You see, new apps for our platform are still being developed. But MIDI doesn't seem to have high priority among the few Atari programmers that are still around. Any other active MIDI-app programmers around here ?

Martin Tarenskeen

There was a Stacy that sold on eBay in the US a few months back for a few hundred dollars, but I don't recall the precise amount. My (vague) recollection is that it was somewhere in the $200-$500 range. I assume from your mention of "a few quid" that you're in the UK, and I don't know if you checked the US eBay site or a UK-only site. The auction might also have been old enough that it's no longer on the site. Of course, with auctions it's always a gamble about how much you'll get for something. My hunch, though, is that you'll get enough to justify checking it out and creating an eBay listing. The lack of a battery might be a problem, though; I don't know how easy it'd be for a buyer to replace that item.

Hi Rod,
Thanks for the reply, yes I'm in the UK and I checked the UK,
US and (with a bit of guessing at the lingo) the German Ebay sites,
but to no avail.
I bought the thing 2nd hand from an Atari show and it didn't have a
battery then, but even so I don't imagine the battery would have
lasted that long anyway.
As you say, even if I get 1-200 pounds for it, it's better than
chucking it in the bin.

Thanks,

Potts.

He could try using ParCP instead. It's much faster than floppies or
serial ports but does require a custom cable[0] to link the parallel
ports together.

When I used it, quite some time ago, I consistently achieved transfer
rates of 30 to 40kbytes/sec between an STE and 233MHz PC. I know someone
else that has used it between a Falcon and a PC and achieved steady
rates of over 60kbytes/sec.

[0] Instructions on how to make the cable are included in the program
archive, which should be quite straightforward to anyone that can handle
a soldering iron.

Regards,
David Bolt

I tried a parcp setup similar to yours but with a 233mhz pc and a 48mhz TT
(with caTTamaran accellerator) and achieved speeds varying from 45k per second
up to a 100k/second on a couple tries.

I really don't know anything about magxnet, but the situation with the PCI NIC and Odd's driver might simply be that it requires mint. I am not 100% sure on that however, is that why you are trying to contact the magxnet author?

729. ST emulator, hi res display

Newsgroup: comp.sys.atari.st
Date: 2002-07-04 05:27:26 UTC
From: Lyndon Amsdon <bindon@madasafish.com>
Message-ID: <3d23dcc2179440@madasafish.com>
Source record: 33703

Hi,

Anyone know of a emulator with option to use a higher
resolution? I downloaded Gemulator 2000, but can't find an
option to get more than ST high. It's a 233MMX laptop so the
emulator needs to be quite good as I believe a 233 is just about
OK to use as an emaultor. I only need it to run Scooter PCB
(GEM app), and it's not going to be an alternative to my Falcon
:)

Thanks

730. Atari on MTV Cribs

Newsgroup: comp.sys.atari.st
Date: 2002-07-04 05:28:30 UTC
From: Don <atari@qnet.com>
Message-ID: <3D23DCFE.653453A8@qnet.com>
Source record: 33789

I was watching MTV cribs tonight (Wednesday 3rd of July). The house was Fat Boy Slims. They got to his studio and I started to yelling at the TV because there it was the Atari 1040ST sitting on his desk and it was the only computer to be seen. He even pointed it out. Hope to see more of them soon.

Don

731. STOS Basic - Screen as a String

Newsgroup: comp.sys.atari.st
Date: 2002-07-04 07:32:03 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <ag0tjv$e46$1@pegasus.csx.cam.ac.uk>
Source record: 33790
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

I'm trying to write my first STOS 3D game and am having trouble with the intro screen, I thought that one method of solving it might be to take several snapshots (about 30) of the screen and store them as strings (either in a file or bank) so that they can be loaded and then dispalyed in sequence like the frames of a film to produce an animation.

So does anyone know how to store and retrieve serveral stings from one file/bank?, also would each string stored need a different name to be able to recover them?
Alternatively does anyone know how to get STOS to run IFF animations created by Delux Paint?.

While I have the attention of any STOS users who may still be out there do you know of any active STOS users groups/mailing lists as the list at Manchester University which had about 20 subscribers has closed. I know it did not recieve a lot of postings but I was nice to have a place to go if you needed help and advice.

Has anyone else seen this?, I saw it last week on CH4 (UK).
The Atari/Fuji logo with something like licencing or interactive
written underneth it is very briefly zoomed onto the screen from a
distance, it them goes on to show images of some dodgy driving game
for two of the current games machines. The PS2 was one of them and I
think the Game cube was the other.

Hi Grzegorz,

>Yes. One GAL right in the middle. Soldered.

Sounds silly soldering in a GAL! Should have it socketed if a
upgrade was/is needed.

>But as it is ET-4000 based, NVDI 5.03 should work with it without any
>additional drivers. But it doesn't! Why?

Is the ET-6000 really compatible to the ET-4000. Mavbe worth
getting an ET-4000? I didn't think they were compatible.

I have checked what VDI says about graphic mode, in 256 color it is
quite OK, but in 15-bit color... That's CRAZY:

Max. palette colors: 32768 (OK)
Available colors: 16384 (?)
Number of planes (16 bit!)

> Regarding MagiC, I can only assume that it uses its driver files
> similarly to NVDI. I know nothing about them, but MagiC is supposed to
> work fine with an Eclipse/RageII without doing anything about them.

BTW can I use fVDI with TC6100AF card (supposed to be ET4000AX
compatible)? Or only with Eclipse/RageII?

> By the way, how did you find out what files NVDI and MagiC used?

By renaming them and restarting the system in various modes. If the system halted, I knew that the renamed driver was needed ;-)

Am I desperate or something? ;-)

I tried using SYS_MON to monitor Gemdos calls, but the output went to the "real" monitor, not to the one connected to the card, so I gave up (I have just one VGA monitor here...)

> graphic card at all). :-(((

It cannot be changed in the config file, but I have found it in the
driver. I doubt if anyone's interested ;-) but in STA_VDI from NOVA 2.12
these are two words at 0x18A47. It is the size of the pixel in microns,
according to which vector fonts are scaled. It was 01 74 01 74
(372 and 372) there, I have changed it to 01 49 01 49 (305 and 305)
and now the fonts seem to be scalled correctly. I will have to
experiment a bit to adjust this value I suppose. :-)

It might be this. It turned out that when I temporarily covered the card
with a aluminum foil ;-) (first I protected it from shortcut) it begun
to be more stable. Also when I *removed* all the inner metal shields
from the TT, the card was *more* stable (?!)

So it seems it has something to do with interference. Now I am preparing
a metal shield for the card from and old CD-ROM drive ;-)

Thanx for all the suggestions. I hope that the better shielding of the
card will help.

I have 2.12 version, but it is for TT only (compiled for 68030)
so it won't work on Mega STE.

I also look for NOVA drivers, preferably 2.4x or 2.5x.

Hi Grzegorz,

>The interface has a writing "VME TO IBM" on it, no manufacturer or
>anything else is stated. The card has ET4000AX graphic chip on it
>(Tseng TC6100AF to be exact). Together with it I got NOVA 2.12 drivers.

Well in that case it isn't a Nova card, cards produced by Nova carry a Nova signature and copyright tag. Nova stopped support for the ET4000 card in 1996 so the driver being only version 2.12 makes sense.

>> 2. Are you sure the graphic card is the original one? If not you may have
>>to change the GAL chip on the VME interface, IIRC Nova had three different
>>GAL's for the ET-4000 cards.
>
>I don't know if it's the original one. How can I check for which type of
>card the GAL chip is for?

Since the interface isn't build by Nova, I dont have a clue. Is there a GAL sitting somewhere on that interface in the first place? Nova didn't sell the GAL chip separately, when someone upgraded his card, he received new drivers, the graphic card and a new GAL that matched the graphic card. When I upgraded from the Mach32 to the Mach64 card, I received a similar package, when using the Mach64 card with the old GAL in place, I experienced similar behaviour as you do...for the Mach serie, there were only two GAL's, for the ET4000 serie there used to be three GAL's...

> What card would work well with this interface?

That's the one million dollar question, Grzegorz.... ;-)
IIRC there were different kinds of ET4000 cards around, I remember reading somewhere that ET4000 cards with acceleration for Windows were no good with the Nova drivers.
But it's al very vague... :-/
I'll try do dig up some additional info about it, there must be *something* written about this topic somewhere...

>BTW in 32k color modes no icons are displayed, why? There are just
>black squares instead of them... :-(

That's a driver problem...
With older drivers for the Mach32 and 64 cards the same thing occurs, only since version 2.61 this has been corrected.

>And (in all modes) the vector fonts are smaller, I have to change 10pt to
>14pt in CAB to get a readable text. In Papyrus it's the same, text is
>displayed smaller than is printed out... No more WYSIWYG :-((

That's an NVDI problem.... which has been corrected since NVDI 4.xx, but I suppose you are running an older version of NVDI in order to get the 2.12 Nova driver working?
Papyrus however offers a solution for this problem:
Go to the menu-item "Settings", select the "compatibility" entry and make sure that the "91.3 DPI" option is selected (crossed) in the dialog-box, for printing the "MEMORY.SYS" option must be crossed as well, save the settings, restart Papyrus and voila... WYSIWYG is back :-)

>Could anyone (please!) send me NOVA 2.55 or similar version (higher than
>2.12 and lower than 2.60 because 2.60 and 2.67 does not work with my
>card....)

Sorry, but these do not exist...
Nova drivers from 2.25 onwards only support the Mach 32 or Mach64 cards, like I said earlier, Nova stopped supporting the ET-4000 way back in 1996.

Cheers from Belgium
Dennis

Standard Atari VDI has 265 there. Why NOVA authors used 372?
I have changed it to 265 and now I have WYSIWYG in Papyrus and CAB.

Yes. One GAL right in the middle. Soldered.

There is just one GAL here... Maybe it is a different VME/ISA interface?
Maybe not only NOVA could create such a thing, maybe someone else
produced them? "MILA Electronics", as it is written on the interface, but
who are they?

> > What card would work well with this interface?

I use NVDI 5.03 ;-)

> Papyrus however offers a solution for this problem:

I have tried that, and I have tried nearly everything that came to my
mind, but as it turned out to be impossible to correct in a normal way,
I had to modify the driver itself ;-)))

> >Could anyone (please!) send me NOVA 2.55 or similar version (higher than

Why didn't thy make the drivers backward-compatible?
But as it is ET-4000 based, NVDI 5.03 should work with it without any
additional drivers. But it doesn't! Why? I have get the addresses
using Dan Ackerman's NOVAINFO.TOS utility, but VMG-4000.PRG didn't
work with these (when I clicked on TEST PICTURE the screen on the monitor
connected to the card remained black). I was using VMG-4000.PRG
on a standard Atari display. When I tried to start it with NOVA
drivers, it said that I need newer XVGA drivers. What does it mean?
What are XVGA drivers? Aren't they included with NVDI? But I cannot
use them at all, because REDIRECT.PRG from NVDI package does not

work at all (screen remains black). I thought NVDI supported ET-4000
cards?

>
>Anyway, I'll look for ISA ET-4000 card...

There seems to be a lot of different cards with Tseng chipsets,
mine has ET4000AX IIRC on the chip, and I think that works on
Ataris.

I tried all sorts of things to make nvdi drive my nova on it's own too.
Just as you have done, always to end up with a black screen. I also
tried entering the screen address and such returned by novainfo.
I don't think Dan got nvdi to drive his nova by itself either.
Nothing I did would make it work. I think nvdi only supports et4k
cards that are directly on the vme bus, without any adapters.
It is my theory that the nova software initializes the GAL on the adapter,
or does something to kick the adapter alive so that the isa to vme
connection is made. If this init part is skipped then nvdi cannot see the
card. This was most frustrating, then having to get nvdi and the nova
software to work happily with each other was a bit of a pain.
This is why I sold the nova card in the end. That is not to say it didn't
work as advertised, my nova did, however the driver arrangement seemed
messy and overly complicated. ;-)

Do you know what exactly has been changed? Maybe there is a readme
file in 2.61 that describes it? Or did they just say "Bugfix: now
you may use icons in 32k color modes?"

Indeed. BTW I have searched the net for that mysterious "MIAN
Electronics" but I haven't found anything... Seems I have an
unique TT graphic card with unknown ISA/VME interface made by
a company that never existed ;-)

Maybe they made it so universal that no upgrade was ever planned? ;-))

It's not ET-6000. It is labeled "TSENG TC-6100AF" and below
there is written "ET-4000AX". So it seems TC-6100 is in fact
ET-4000, but maybe not fully ;-)

Anyway, I'll look for ISA ET-4000 card...

There should be a couple of apps included that go into the Auto Folder,
called WINSIZER & VGAWIN. You can use either. They allow you to change res
at boot-up. I guess some programs may work with one and not the other.

>I have checked what VDI says about graphic mode, in 256 color it is
>quite OK, but in 15-bit color... That's CRAZY:
>
>Max. palette colors: 32768 (OK)

I'm not sure what number that is supposed to be, but the only obvious
ones I can think of right now are intout[13] from v_opnvwk, which should
never be higher than 256 or intout[39] which is supposed to show 0
for any number of total possible colours higher than 32767 according
to my VDI documentation.

So, unless I'm missing something, that could be throwing some programs
off regarding how to use your card.

Is it possible for you to check how these numbers are arrived at?
Or better, run my little utility (as soon as I get around to making
it available in the fVDI download area on my site).

>Available colors: 16384 (?)

That sounds really strange. Don't see why anything should give that
numer. Again I'd need to know where from this number is taken.

>Number of planes (16 bit!)

That on the other hand is as it should be. As far as the hardware is
concerned, there are 16 bits per pixel. You just seem to have DACs
that only deal with 5+5+5 bits (a 16th bit would normally be used for
extra resolution on the green component).

>BTW can I use fVDI with TC6100AF card (supposed to be ET4000AX

If someone writes an ISA ET4000 driver...

Should be a relatively simple job really, since you already have
software that can set up graphics modes. Without a driver that makes
use of the hardware acceleration (assuming there is any) on the
ET4000 chip, you might as well use NVDI, though, since you have that.

Actually, it is not at all unlikely that the 16 bit example driver
that is included in the normal fVDI distributions will work (it does
under both Falcon TC and on my Eclipse/RageII in 16 bit mode), if you
start it from the desktop. It is not meant to be fast, though.

>compatible)? Or only with Eclipse/RageII?

Aside from some relatively minor implementation details (some
differences regarding how to deal with PCI cards), the fVDI RageII
driver should work on any PCI capable Atari compatible machine.
(Some work late last year got it to the point of displaying a blank
screen on a Milan. ;-)

It only supports the RageII chip (and only two variants of that for
the time being), however, which is in no way compatible with your
ET4000.

An ISA bus is another complication. I've never worked with it, but I
would assume that it must be limited to the 1 Mbyte address space of
the old x86 chips. Probably significantly less.
(The Eclipse PCI BIOS uses the MMU for transparent banking of the
PCI memory space into a small window of physical CPU memory space
(which is why it works with 14 Mbyte RAM cards).)

>Standard Atari VDI has 265 there. Why NOVA authors used 372?
>I have changed it to 265 and now I have WYSIWYG in Papyrus and CAB.

The pixel size in microns will of course in reality depend on the size
of your screen as well as your resolution.
True WYSIWYG would have a 10 point font on your screen as the exact
same actual size as a 10 point font on paper.

My main VDI documentation says the two values are supposed to be the
horizontal and vertical components of the aspect ratio for a screen.
But then it goes on to say that the values are 372/372 (ST high),
169/372 (ST medium), 338/372 (ST low)...

fVDI allows you to specify your actual screen size (it will then
calculate the numbers depending on your graphics mode), or to give
absolute numbers.

There were likely VME->ISA boards made that never had anything to do
with Ataris. I don't know much about either VME or ISA, but it isn't
at all impossible that such a board would work to some degree (or for
that matter perfectly) with drivers intended for a NOVA board.

>> the graphic card and a new GAL that matched the graphic card. When I upgraded

>> you do...for the Mach serie, there were only two GAL's, for the ET4000 serie

Interesting. I wonder what those GAL's where used for if it was not a
'simple' VME->ISA mapping (which shouldn't require any updating).

I forgot to ask this before, but I take it you are seeing colour images
in other programs, such as Kronos?
If so, this is almost guaranteed to only be a matter of fixing some of
the returned values you mentioned earlier (or some other similar ones).

>> Nova drivers from 2.25 onwards only support the Mach 32 or Mach64 cards, like
>> I said earlier, Nova stopped supporting the ET-4000 way back in 1996.
>
>Why didn't thy make the drivers backward-compatible?

Different chip -> different setup.

Without using hardware acceleration, it is possible to use the same
code for the actual drawing. Even then it is necessary that the frame
buffers looks the same too, though.

>work at all (screen remains black). I thought NVDI supported ET-4000

Even if it knows how the hardware acceleration works, what the frame buffer looks like, etc, the setup of graphics modes can differ between cards. Things like clock frequency, memory type, amount of memory and type of RAMDAC (if it is external) makes for a lot of difference regarding how to get a graphics mode working.

For example, the two RageII cards that the fVDI driver currently supports only differs regarding the amount of memory as far as anything besides the setup code is concerned. If you force the driver to use the 2 Mbyte card setup for a 4 Mbyte one, however (can occur if the PCI BIOS does not start, as happened to me a couple of days ago (I moved around a few directories without thinking, and PCIBIOS.PRG was in one of them)), you will get a display that, while it is just about usable, is covered with what looks like random horizontal lines, in different colours and lengths, some stable and some flickering. Not a pretty sight...

Hi, I'm Ben Smith of Bravo Sierra Computers. A reseller of Used and New Atari 8 Bit & ST Computer Lines as well as Atari Jaguar Game systems! I'm announcing a Contest! Whoever can write the best Submission for the "Why you should buy Atari from Bravo Sierra Contest!" My Customers are living examples of why to buy from Bravo Sierra! More satisfied Customers & the number keeps growing! Submissions judged on persuasiveness. Originality would be nice but not required. Personal testimonials preferred! Please include your real name (No aliases without your real name!) and where your from. Please submit your entry by Thursday, August 15th. Contest will last 6 weeks, but could last longer should I deem necessary. Prize for the most persuasive entry Wins $25 U.S. Dollars in Cash or Money Order. Entries can come from any Country! All entries become the property of Bravo Sierra Computers! Please E-Mail all entries to atari@aracnet.com plus results will be shown at the HotLink Below!

http://www.aracnet.com/~atari/whybuyben.htm Contest WebPage

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@aracnet.com. If you can't reach me at benjamin.net see my E-Mail/Web/Phone info in my Signature at the Bottom!

Bravo Sierra Computers has moved to a new Internet Provider atari@aracnet.com Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on the web at http://www.aracnet.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@aracnet.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

762. External HD with Internal HD Conflicts?

Newsgroup: comp.sys.atari.st

If I plug an external MegaFile 20 (with 3 partitions) into a Mega STe which has its own internal hard drive (with 6 partitions), will there be a conflict with possible damaging one or both HDs or even their partition tables?

The external partitions are labelled C, D and E. The internal drive's partitions are labelled C through H. How would the partitions keep things straight where there would be 2 C's, 2 D's etc?

Thanks...

This depends on your hard disk driver. Usually the partitions are
ordered according to the ACSI/SCSI ID of the drive, starting with C: on
the internal drive. Hard disk drivers like HDDRIVER provide means for
changing this order.

That won't physically damage anything. And I don't think there could
be any partition conflict that could lead to data corruption, except
if SCSI adresses aren't actually independant from ACSI ones...
In this case, you should just change the internal disk's ID to one
different from "0" to fix it.

>The external partitions are labelled C, D and E. The internal drive's
>partitions are labelled C through H. How would the partitions keep things
>straight where there would be 2 C's, 2 D's etc?
Assuming your driver is correctly set, you will get C through K, the
order depending on which drive starts first - I would assume the
internal to start first, so you should get (C ~ H) + (I ~ K).
Most drivers allow to select the order the system will see the units.
I don't know about AHDI, but at least CBHD, SCSI-TOOL, HDDRIVER and
(IIRC) ICD do.

The only (I know you pedants can probaly think of other ways but we are
talking real life here) possibility of damage would be if you connected both
drives to the same SCSI bus and gave them the same SCSI ID number. Assuming
you have an internal IDE adaptor (I don't think you coudl fit SCSI inside
the machine) then you can't do that.

> The external partitions are labelled C, D and E. The internal drive's
> partitions are labelled C through H. How would the partitions keep things
> straight where there would be 2 C's, 2 D's etc?
>

Avoiding the quagmire of terminology, the important thing is the "Drive
Letter" which is dynamically assigned as the driver scans each disk, and its
partitions in turn. It is not stored (certainly in the original partitioning
schems) in the disk partition table. So usually the internal drive gets
scanned first and will retain its initial letters. The external drive will
be scanned next and its partitions will usually be assigned the next three
free drive letters, I,J and K. As Uwe says some later drivers do allow
partitions to be re-ordered, but again if a letter is already in uses these
will usually assign it the next free letter.

Again depending on software in use, you may have to do an "Install Devices"
or whatever to get the extra ICONS for the added partitions.

> Thanks...
>

Thats O.K....

Yes, but there is nothing about it. Only misspelled "Milan" and
"main" ;-)

But I have found "MIAN Electronics" company. It is located in
Rawal Pindi, in Pakistan.

I didn't ask them if they did that VMA/ISA interface, but there
is no other MIAN Electronics that could be found on the net...

This one was takend from work_out(39). The first one was reported
by a kind of a German diagnostic utility, but as I don't understand
German I cannot say for sure what it is... In work_out(13) there
is 256 even in 32k color modes, although Aniplayer recognises 32k
colors properly (and display is OK); Imagecopy says there are
65536 colors available with no palette.

Could you please send me your VDI checking utility? Can it write
all those informations into a file? It would be usefull, as I don't
know much about the extended VDI information, etc. I can just dump
work_out() table into a file ;-)

> >Number of planes (16 bit!)
>

> extra resolution on the green component).

OK, now I understand ;-)

BTW here is the complete work_out() table in a 256 color mode I use:

```
work_out(0) = 655
work_out(1) = 479
work_out(2) = 0
work_out(3) = 265 ; these are those scaling values
work_out(4) = 265 ; I had to change
work_out(5) = 3
work_out(6) = 7
work_out(7) = 0
work_out(8) = 6
work_out(9) = 8
work_out(10) = 1
work_out(11) = 24
work_out(12) = 12
work_out(13) = 256 ; max. colors
work_out(14) = 10
work_out(15) = 1
work_out(16) = 2
work_out(17) = 3
work_out(18) = 4
work_out(19) = 5
work_out(20) = 6
work_out(21) = 7
work_out(22) = 8
work_out(23) = 9
work_out(24) = 10
work_out(25) = 3
work_out(26) = 0
work_out(27) = 3
work_out(28) = 3
work_out(29) = 3
work_out(30) = 0
work_out(31) = 3
work_out(32) = 0
work_out(33) = 3
work_out(34) = 2
work_out(35) = 1
work_out(36) = 1
work_out(37) = 1
work_out(38) = 0
work_out(39) = 16384 ; available colors in palette
work_out(40) = 2
work_out(41) = 1
work_out(42) = 1
work_out(43) = 1
work_out(44) = 2
```

```
work_out(45) = 6
work_out(46) = 4
work_out(47) = 8
work_out(48) = 13
work_out(49) = 1
work_out(50) = 0
work_out(51) = 40
work_out(52) = 0
work_out(53) = 15
work_out(54) = 11
work_out(55) = 120
work_out(56) = 88
```

Things are getting funny in a 32k color mode:

```
work_out(0) = 639
work_out(1) = 479
work_out(2) = 0
work_out(3) = 265
work_out(4) = 265
work_out(5) = 3
work_out(6) = 7
work_out(7) = 0
work_out(8) = 6
work_out(9) = 8
work_out(10) = 1
work_out(11) = 24
work_out(12) = 12
work_out(13) = 256 ; max. colors in 32k color mode is 256 (?)
work_out(14) = 10
work_out(15) = 1
work_out(16) = 2
work_out(17) = 3
work_out(18) = 4
work_out(19) = 5
work_out(20) = 6
work_out(21) = 7
work_out(22) = 8
work_out(23) = 9
work_out(24) = 10
work_out(25) = 3
work_out(26) = 0
work_out(27) = 3
work_out(28) = 3
work_out(29) = 3
work_out(30) = 0
work_out(31) = 3
work_out(32) = 0
work_out(33) = 3
work_out(34) = 2
work_out(35) = 1
```

```
work_out(36) = 1
work_out(37) = 1
work_out(38) = 0
work_out(39) = 16384 ; in 32k mode there are 16384 colors available (?)
work_out(40) = 2
work_out(41) = 1
work_out(42) = 1
work_out(43) = 1
work_out(44) = 2
work_out(45) = 6
work_out(46) = 4
work_out(47) = 8
work_out(48) = 13
work_out(49) = 1
work_out(50) = 0
work_out(51) = 40
work_out(52) = 0
work_out(53) = 15
work_out(54) = 11
work_out(55) = 120
work_out(56) = 88
```

I would say they are exactly the same... ;-)

Could you please send me your VDI checking utility?

BTW I have found a photo of a NOVA vma/isa interface (in an old ST-Format
magazine) - the one I have is a half shorter than this. But the width
is the same, it fits *exactly* into that metal shield around the vme
port inside of the TT, so it seems it has been prepared for Atari.

Most programs work OK: I can view jpegs with 1stGuide, also CAB works
great with GIF and JPEG images, Aniplayer display is correct, Kronos
and zBench display is also correct. OpenGL test is very fast ;-)

However, the programs that rely on NVDI bitmap functions (such as
Papillon 3.04) do not display anything in 32k color modes. They do
work in 256 colors, but in 32k there is no image at all, in Papillon
there is no color palette displayed when I create a new picture, all
colors are displayed white. But in 256 colors it works well.

There should be a utility included named VGAWIN which, put in AUTO folder, would enable you to choose betweeen several resolutions, up to 1280 x 800, I think. VGAWIN works with DOS version of Gemulator too, but it can just increase vertical resolution from 400 to 480 (maybe it could do more if the screen could be put in some higher resolution mode by some hack at starting Gemulator/DOS ??)

TOSBox supports higher resolutions too, but they have to be configured beforehand in the .INI file. TOSBox is not as compatible as Gemulator.

One has to fiddle a bit with some options of Interface (concerning
optimization of menu-items lengths) in order to make it do what
one would like in this case, and not what Interface itself thinks
should be done.

Pixart seems to insert shortcus into menu item texts, starting from the
right and leaving one blank.

Serial port to serial port using a null modem, or better, PARCP. Needs a
slightly modified cable to connect the printer ports together but is very fast
and easy to use.

Hi all,

An updated resource file for PixArt 4.52 is now available from
http://www.cix.co.uk/~derryck/ddp/pixrsc.lzh which overcomes the problem
with misaligned shortcuts in the menu.

I've also refreshed the PixArt archive itself, it's available from the DDP
section of my website, URL in sig.

Cheers

Derryck

Hello all ...

I have a question for you lot. When I used to have my real ST up and running (I now use the STEem emulator, due to lack of desk space), I had a great text to speech program that "spoke" using purely synthetic sound chip noises (as opposed to "Smooth Talker" using sampled sound). But I have lost my disk :(

Could anybody send me, or point me in the direction of this program? I am desperate for it as I intend to use it in a small project of mine !

Thanks in advance to those who can help !

775. ArthurXP window size

Newsgroup: comp.sys.atari.st
Date: 2002-07-05 19:44:51 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <ag4svjgin1@thorium.cix.co.uk>
Source record: 33733

Hi!

Anyone downloading the current ArthurXP distribution (2.08) of this very useful translation program (libraries for many language pairs available, including German-English, English-French as well as Italian and many others) may find that the opened window is so big that it is impossible to access the sizer gadget at bottom right to reduce the width to fit the screen. That was the case both on my 640*840 mono screen as well as on 768*480 interlaced on an RGB monitor.

At the author's (R G Faika) suggestion I disabled the CNF file, and all was well - the dialog now fitted the screen and could be resized. Looking at the contents of the CNF, the default size set in that is 724*493. So either use a text editor to change this to match your screen size, or delete/disable the original CNF file, and Arthur will create a new one once you have chosen your options in the dialog and exited the program.

This has been a public service anouncement from DDP.

Regards, /Peter/

776. Help on Atari Mega ST, no colour

Source record: 33734

Hi there,

i am using an Atari Mega ST 2 for my MIDI stuff. I also own some old games and wanted to play some on weekend. So, i connected the Mega ST with a colour screen cable to my TV-Set, normaly it should work fine. But, it is very difficult to see anything. I opened the eyes and i can hardly see the desktop on the TV screen. It is a very dark screen i get. And, i cannot recognize any colours. I tried two different cables and TV-sets, but the problem remains. I am using TOs 2.06. Does anybody know this problem? Is this a severe hardware problem? In 640*400 Mode on a Atari SM 124, it works without any problem.

Thanks for aour help!

Hello Lonny,

Yes that is why I would like to contact the author. Just to see if the PCI bus is supported. I want to get it working with Magic as well as Mint. Just in case something might happen to my Mint partition like a few days ago when for some reason the boot sectors were wiped out and I had to re-install EasyMint again. I did however, backup the whole partition to a CD. Like I also said, Ozk's driver loads fine under MintNet. I just cannot establish a connection.

I also make music and had also used the Atari for a few years. Okay, it
wasn't
with midi, but the goode olde demo scene spawned craze, the 4 Track
SoundTracker
(AudioSculpture, TCB Tracker and the likes). I've since moved onto the PC
because
of the 32+ channels, but i do miss the old ST :'(
Fantastic piece of kit. in my opinion, nothing as yet has equaled it for its
time!

Long live the fuji !

The authors on the STEEM mailing list tell us that this function is going go
be available in the next release of the "STEEM Engine" (BEST emulator to
date).
I cant remember the website, but search for "steem" on yahoo.com and you'll
find it.

That is normal in TC as the color registers as you know them in register
based mode (256 or less) become color pens in TC. Or rather place holders
for predefind pen colors. All TC modes will report 256 pens.

If you want to check the actual colors allowed by a given mode, it's better
to request the extended vdi inquire, and look at the bit planes the VDI
thinks you are in then just do a simple palette_size=shl(1,bitplanes).

Hope that makes sense. ;-)

The old Megafile external will be attached to the DMA plug in the back of the Mega STe to copy over some software which would be faster than reinstalling everything from floppies. I just didn't them the two drives to bump heads and corrupt either or both.

The Megafile only has AHDI on it and the internal has an ICD boot loader. How do you change the number of the old drive in the Megafile as the Mega STe hard drive is too hard to get at to change any numbers?

...
>This one was takend from work_out(39). The first one was reported

OK. Well, I guess my VDI documentation might be wrong. In any case,
intout[39] isn't terribly helpful since it's only a 16 bit value.

>German I cannot say for sure what it is... In work_out(13) there
>is 256 even in 32k color modes, although Aniplayer recognises 32k

As was mentioned, intout[13] is never higher than 256.

>colors properly (and display is OK); Imagecopy says there are
>65536 colors available with no palette.

It probably does what someone else suggested here then, giving
(1 << bitplanes) as the number of colours, but that is wrong for
your 15 bit mode as well as for a 32 bit mode (or Falcon TC as it is
normally used by the VDI, IIRC (but I might not)).

>Could you please send me your VDI checking utility? Can it write

It is on my web site now. Go via the fVDI page, down into the fVDI
'ftp site' and you'll find it in the 'Misc' directory.
Don't forget to fetch the text file that explains what to do.

>all those informations into a file? It would be usefull, as I don't

It will not do otherwise. ;-)

>know much about the extended VDI information, etc. I can just dump
>work_out() table into a file ;-)

Besides the vq_scrninfo (vq_extnd mode 2, available from EdDI v1.00
and onwards) values, which my program interprets (and can show on the
screen using printf (GEMDOS/BIOS text output, that is)), the rest is
only dumped to a file. It can dump vq_extnd mode 0 (opn_vwk) and
```

mode 1, as well as the lineA variables and some other things, however,
which should cover all there is to find out from the OS regarding the
graphics mode.

>work_out(0) = 655

A typo there, I assume?

>work_out(3) = 265 ; these are those scaling values
>work_out(4) = 265 ; I had to change

I think you should try calculating them from your screen size and
resolution.

>work_out(13) = 256 ; max. colors in 32k color mode is 256 (?)

Quite as it should be.

>work_out(39) = 16384 ; in 32k mode there are 16384 colors available (?)

Does not seem right, but I doubt any program would try to use it.
vq_scrninfo (see above) provides a 32 bit value that gives the number
of possible colours, as well as ways to describe the format of a pixel
in the frame buffer (well, in a device specific bitmap, anyway, which
is often, but not necessarily, the same thing) in detail.

>Could you please send me your VDI checking utility?

See above.

I have had this problem with my STe and its either the lead or the TV. The
MEGA only produces RGB out and your leads (or TVs) are either only designed
for composite, or the way the SYNC is being generated is fooling the TV into
looking for Composite. I know someone sent me the solution some time ago but
I can't find it. Try checking out the group archives at groups.google.com...

Dave.

Just rename hotlist.htm into hotlist.html.
I'm not sure but I believe you must use lowercases too.

Martin,
I had a similar problem quite some time ago with my
CAB version 2.8 but I was using MAGIC. The answer
lies in the fact that MINT is a long filename OS and
so is MAGIC but single TOS is 8.3 filenames. Check
inside of CAB folder and find HOTLIST.HTM if it is
typed like this change the filename to HOTLIST.HTML
This will fix your problem.

Thanks,
Carey Christenson

Chin-Whan,
I also have had a similar problem with my Falcon030.
When I first got it and wanted to hook it to a 19 inch
VGA monitor. I found that it was a setting inside of
NVRAM. Do you use a program like this??? For
VIDEONORM I have PAL and VGA clicked on for VIDEOMODUS
I have nothing clicked on but there are other options
as well. Now that I have an Eclipse ATI GC I dont
even need to worry about this program. Hope this
helps!!!!

Thanks,
Carey Christenson

798. Internal HD not recognizing...

Newsgroup: comp.sys.atari.st
Date: 2002-07-06 20:52:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1020706174718.17236A-100000@halifax.chebucto.ns.ca>
Source record: 33656

I hooked up the external Megafile 20 to my Mega STe and changed the SCSI switch settings on the switch in the external HD and tried a boot. At first, the Mega would simply boot as normal and ignore the external HD. Now the Mega doesn't even recognize its own HD with the multiple partitions and isntead simply runs the empty floppy drive for a while before giving me a basic screen of 2 floppy icons and a trash can.

I've unhooked the external and have tried booting the Mega with its internal only. Repeated bootings fail to recognize the internal HD.

What now?

799. Re: Internal HD not recognizing...

Source record: 33657

Okay, a followup to my previous posting.

I took the HD out of the Mega STe, reseated a few chips, cleaning off any possible corrosion and tapping the HD lightly on the side to see if stichtion was a problem. The HD started working on its side but not lying flat. I reseated the daughterboard and its chips and tried it again. The HD seems to be back functioning again.

Whew!

Hmm, strange behaviour. But I have it working now. I have my CAB folder on a TOS partition. So I've copied "HOTLIST.HTM" from there to my $HOME directory, which is on a ext2 MiNT partition, and renamed it to "hotlist.html". CAB apparently also looks for it on that location. Now I can use CAB and the Hotlist both with MiNTnet and with STiK2/Single TOS. Why should I, but it is possible :-)

Are you using RGB cables or composite video cables and is the relevant
monitor set to match.

Some types of monitor require a 12 volt at 10K ohm pull-up on pin 8 of its
SCART socket to force it into composite mode and 12v at 10K ohm pull-up to
pins 8 and 12 to force RGB.

Its also possible you need to cycle your TV through its modes, i.e,
COMPOSITE/RGB/svhs, maybe even PAL/ntsc to get the correct result.

806. XaAES v0.951

Newsgroup: comp.sys.atari.st
Date: 2002-07-08 00:28:08 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3D28DC66.AD0DE191@chello.nl>
Source record: 33663

LS

A new version of XaAES is available on my homepage

1
At last got the button down fallthrough event working.
(Fall through evnt_multi(MU_BUTTON, down) and the button is already (or still) down)

Good news for CAB users among many others.

2
Fix in button event handling: if the mouse is locked and the app has a classic
dialogue on the screen and is not in a form_do() and is waiting for mouse
events, it will now recieve the event.

3
More fixes in fitting text in boxes. Now 3D widening effect is taken into
account.

4
More fixes in drawing of transparent text.

5
More fixes in handling windowed and classic dialogues.
(Because window creation is postponed until form_do() is called, I could
do away with the handling of the 3 pixel gap caused by form_center() on
outlined boxes).

6
Fix in graf_slidebox():
Forgot to set the mouse distance rectangle properly.

Have fun.
Read the history file!

807. New on TAMW: Brainwaves and Notator

Newsgroup: comp.sys.atari.st
Date: 2002-07-08 04:58:54 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0207072058.3b542c0d@posting.google.com>
Source record: 33664

Hi All:

New stuff on TAMW !!

http://tamw.atari-users.net/brainwav.htm

This is marc marc's BRAIN WAVE LAB! Thats right!! WE ARE IN CONTROL:-)
Check out this unusual software.

http://tamw.atari-users.net/notator.htm

THATS RIGHT2! A NOTATOR page...Finally!!!!..thanks to David Etheridge and
his excellent article illustrated with Hallvards Notator screen shots! (Hope
you don't mind Hallvard)all credit is given of course! I plan to expand it
when I get more time.

I also reorganized my front page so all the apps have catagories instead of
random-tandom. You can now actually FIND something:-)

http://tamw.atari-users.net/timidi.htm

Comments welcome

Tim

808. Atari St1024 and signum

Newsgroup: comp.sys.atari.st
Date: 2002-07-08 14:17:24 UTC
From: Hartmut Surmann <Hartmut.Surmann@ais.fraunhofer.de>
Message-ID: <3D299EF4.4A68E3A0@ais.fraunhofer.de>
Source record: 33665

Hi,

15 years ago i wrote my master thesis on an atari 1024 ST with
a text program called signum. Now, i am looking for a possibilty
to read or convert these old signum files? Any hints?

My first idea was to use an simulator.
I found an atari 1024ST emulator for linux but
i didn't have the old programm files (signum).
Any hints were i can download the softare?

Thanks
Hartmut Surmann

809. GodPey under MagiC

Newsgroup: comp.sys.atari.st
Date: 2002-07-08 17:14:15 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3d29c85e$0$256$4c56ba96@master.news.zetnet.net>
Source record: 33667

Hi all!

When GodPey from Reservoir Gods came out, I tried to run it under MagiC on my Falcon. It didn't work, it just freezes on the title screen.

Then I ran it under TOS, this time it worked. After a few plays I found the music annoying, so I turned it off and switched on sound fx only. But there was no sound at all. I thought it was a bug.

So I played it for some time with no sound at all.

Then I wondered whether unpacking the program would help it run under MagiC? I tried it and it worked! And wonder of wonder I was now getting sound fxs too! The only problem was that their timing was out.

So now I run GodPey under MagiC in Single-Task mode which sorts out this last problem.

I don't understand why I didn't get any sound fx under TOS, but I at least I've managed to find a good solution!

I assume that the packer used with GodPey works under MiNT, and doesn't under MagiC. Is there not a packer that works under both OSes?

Get GodPey either from my website or from Reservoir Gods
http://www.reservoir-gods.com

Cheers!

James

With this kind of thing, when I had this problem before, we had two
different Scart cables. A Sony one that was supplied by a local dealer, and
one Philips, that came with the CM8833 monitor.
It seems thats the Sony and Philips cables had slightly different pinouts.
I'm not sure where you can get diffreent cables from today, but if you get
the pinouts from somewhere, i'm sure you could get an electronics shop of
some kind to fit it for you.

812. help! desperatley seeking 030 falcon...

Newsgroup: comp.sys.atari.st
Date: 2002-07-09 11:18:27 UTC
From: Chance Hooper <chance@cybertrophic.com>
Message-ID: <agegq3$m5i$1@helle.btinternet.com>
Source record: 33670

Hi - I live in the UK and am desperate to find a high-spec falcon 030 (preferably with cubase) so I can finally set up my home studio having rejigged all the furniture in the house.... :-)
I am not after a Milan, etc box, just the normal atari falcon 68030 with 14 meg(?) of ram and a decent hard-disk (the bigger the better), monitors, software, accelerators, etc are all useful too, but not critical. I will pay a fair price as I don't believe in stiffing people for a computer they love - have had a few people try that with my old SGI boxes...
any advice/offers/info is appreciated.
Thanks for your time!
long live the Atari ST/Falcon!

Chance

I have two, both C-Labs.

One is a Mk X, Blowup hardware, 3gig SCSI etc.

T'other is a Mk II, needs an IDE drive and bracket.

I don't give 'em away........

Cubase Audio available separately.

right, bit new to Falcons - are the MkX and Mk II in the original all-in-one
ST style case? and obviously if the spec is right, I am happy to pay a fair
price. any ideas on a price for cubase, by the way?

816. Re: help! desperatley seeking 030 falcon...

```
MK-X is in a separate black case. Quite attractive. MK-II is in an ST style
case. Both MK-X and MK-II have a modifed SCSI port to allow for a 2.5" SCSI
drive inside the case. Naturally, coming from C-Lab, both systems have the
Falcon audio patch/modification done proffesionally.

Joshua.

There was a post recently with the projects current status. The CT060
website has also been updated. From what he says however, if you
haven't already made some sort of commitment for purchase, your likely
out of luck getting one.
Mike

I used it until NAES was available. Worked fine with MiNT on an
Afterburner 040 and NOVA video card. I think it's more of a
programmers nightmare than it is for an everyday user:)

My ICD link that plugs into the DMA port has a programmed chip
inside, and it's not a GAL and likely to have it's fused burnt
to stop people reading the internal layout.

Update, Dr. Uwe Seimet pointed me in the right direction, I used
HDriver to partition one of my disk for the Syquest 135mg removable for
both PC and Atari use and the new Notebook reads it fine. Also I
discovered that Gemulator 2000 for the Atari is now free so I installed
it on the Notebook and it will read all the drives even my 2gig JAZ 4
petitioned. So try http://www.emulators.com

Later, Donner....

825. ICD Link/2 Troubles

Newsgroup: comp.sys.atari.st
Date: 2002-07-10 06:29:33 UTC
From: mduckworth@nospa-am.matchie.net
Message-ID: <1026282618.526875@pikachu>
Source record: 33682

Hello everyone,

I was wondering if anyone would happen to have any advice for me. I recently purchased a new Mega STe to replace the fried one I already had and apparently the Link got taken down too. It works and the light lights up but it doesn't get detected by ICD's software. It is the clear link/2 denoted on ICD's website. Is that surface mount chip on the adapter something I might be able to find in a store or an ICD custom chip?
I sent a mail to ICD suport but does anyone have any other ideas and most importantly, does anyone in the US or canada have a link or mega ste compat internal scsi host adapter for sale for a bit less than $100?

Thanks
Mark - http://atari-source.com

It's me to whom you should have addressed your question.

The URL is in my sig as always.

For anyone who's already downloaded the full archive and wants just the
updated resource file (keyboard shortcuts correctly lined up in menu items),
it's directly downloadable from:

http://www.cix.co.uk/~derryck/ddp/pixrsc.lzh

I'll be removing that file from the web site the next time it's updated.

Cheers

Derryck

I have downloaded your utility, and it reported the following:

For the 256 color mode:

[--]

Format: k[character dec. 24] @a
CLUT: None
Planes: 31
Colours: 8
Width: 1 bytes
Address: $17700001 ($fec00000/$fec00000)
Bits: 1+4+2 (+1+0+0)
Order: Unknown
AES background buffer at $11bff28 (145824 bytes)

```
Open Workstation values
783 495 0 265 265 3 7 0 6 8
1 24 12 256 10 1 2 3 4 5
6 7 8 9 10 3 0 3 3 3
0 3 0 3 2 1 1 1 0 16384
2 1 1 1 2
6, 4 8, 13 1, 0
40, 0 15, 11 120, 88

Extended Inquiry values
4 0 31 0 8 1 6000 1 1 4
2 1 0 0 512 -1 2 0 4 0
0 0 0 0 0 0 0 0 1 0
6 0 0 7 0 7 1 0 40 0
15 11 120 88 1
0, 0 783, 495 0, 0
0, 0 0, 0 0, 0

[----------------------------------------]

And for 32k color mode:

[----------------------------------------]

Format: k[character dec. 24] @a
CLUT: None
Planes: 31
Colours: 16
Width: 0 bytes
Address: $17700001 ($fec00000/$fec00000)
Bits: 1+4+2 (+1+0+0)
Order: Unknown
AES background buffer at $11bdc88 (291648 bytes)

Open Workstation values
783 495 0 265 265 3 7 0 6 8
1 24 12 256 10 1 2 3 4 5
6 7 8 9 10 3 0 3 3 3
0 3 0 3 2 1 1 1 0 16384
2 1 1 1 2
6, 4 8, 13 1, 0
40, 0 15, 11 120, 88

Extended Inquiry values
4 0 31 0 16 0 6000 1 1 4
2 1 0 0 512 -1 2 0 4 0
0 0 0 0 0 0 0 0 1 0
6 0 0 7 0 7 1 0 40 0
15 11 120 88 1
0, 0 783, 495 0, 0
0, 0 0, 0 0, 0

[----------------------------------------]
```

Instead of [character dec 24] there was a character that cannot be
e-mailed (I suppose?). Code 24 decimal.

Could you please take a look at those and tell me what's wrong with
that? ;-) And please send me what does this utility report for a *working*
32k color modes, to compare it.

Message-ID: <1026322878-007325AEicMi@xs4all.nl>
Source record: 33685

Does anyone know how to change to B/W resolution
with a NOVAGraphic card. I know that you can make
your own rez's with an according program but has
someone ever done that? To my TT there's a IYama
17" monitor attached. Most of my rez's are in
70Hz...

The finest solution would be that I could switch
with the Nova Acc. to use elder programs that
only want to work in B/W.

Thanks in advance,

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

You may use VMG_TT.PRG (in VORSICHT folder) to make or adjust resolutions. They must be saved in STA_VDI.BIB file in the AUTO folder. I have made a lot of my own graphic modes, because the ones supplied with NOVA weren't very useable for me (either too low resolutions or too much interlace).

If you want to create a B/W resolution, choose any mode that has 256 colors (using VMG_TT.PRG, "Auflosung laden" option), change the color number ("Farben") to 2, change the name ("Auflosungsname") of the mode (it's important, when you change the name it will be saved as a new mode, when you don't change it, it will overwrite the existing one).

You *cannot* do that change with 32k, 65k or 16m color modes, because switching from so much colors to B/W need also certain changes with frequencies (lower pixeltakt). But when you change from 256 to 2 colors you shouldn't need to adjust anything else. Save the mode ("Auflosung sichern"), test it ("Werte setzen") to see if it works OK (a test picture will be shown).

Note that using "Auflosung laden" option opens a dialog box in which you may choose the graphic modes library. Make sure ("Biblitheksname") that you are changing STA_VDI.BIB file in your AUTO folder, *not* RES_BIB or any other.

Also, it is said that using too high frequencies might damage the monitor, so be careful while playing with VMG_TT.PRG, and don't change "Maximal Frequenzen" setting.

BTW if you want to make a B/W mode only, you may just open EMULATOR.BIB modes library, and copy the standard 640x400x2 mode from there into STA_VDI.BIB.

Falcon for sale.
TOS 4.04
4mb Ram
60mb Internal drive
NVDI 2.50
Originally supplied 1993, motherboard replaced 1996.

Also for sale:
Cubase 3.1 with key and manuals (NB This is MIDI only, not Audio)
Roland SC55 sound canvas
14" Monitor - High resolution - not Atari but as supplied by System Solutions a while ago. (This flickers for a while when first switched on so may have a fault).

Offers please, preferably UK.

The machine is near Peterborough.

Paul

> able to recover them?

I'm a little rusty but will try to help you. If you just want to store images in a bank then I think the missing link extension allows you to store more than 1 image in a bank and recover it. If you want to put it in there yourself then you want something like..

```
reserve as data 10,32768*5 ( 5 full screen images )
load "pic1.pi1",start(10)
load "pic2.pi1",start(10)+32768
load "pic3.pi1",start(10)+32768*2
load "pic4.pi1",start(10)+32768*3
load "pic5.pi1",start(10)+32768*4
```

then all 5 pics will be in bank 10. then all you need to do is use COPY to copy the block back from the bank to the logical screen. The missing link has a much better version of COPY (i think).....you would use something like....

```
copy start(10)+(32768*PICNUM),logic
```

I can;t remember the syntax offhand, screencopy *should* also work since you are storing valid image data in a bank. PICNUM is the number of the pic you want to display on screen.

Once you get the hang of that idea you can then use the STOS Squasher or even Atomic to compress them and store them in compressed form in the banks to save space ;) I wouldn't use the screen banks to store images, its a bit limiting really, but fine if you only want a few images.

> Alternatively does anyone know how to get STOS to run IFF animations
> created by Delux Paint?.

erm, I think there was, I would check out STOSSER im sure its in there
somewhere!

If your VDI does not support EdDI v1.00 or better, those values will
have nothing to do with reality. My test program does not check...

Regarding the detailed numbers, contact me via email.

>Could you please take a look at those and tell me what's wrong with
>that? ;-) And please send me what does this utility report for a *working*
>32k color modes, to compare it.

Suffice it to say here that the 16384 you have in there is 0 here,
as I mentioned earlier. The rest of the differences are not relevant
concerning colours.

So, the remaining possibilities are, AFAICS:
- That 16384 vs 0, but that is very unlikely to ever be used.
- LineA variable (used by a lot more software than one would have hoped)
problems. (Send along your values in an email.)
- Possibly the lack of EdDI v1.00 (vq_scrninfo), but I would not have
thought programs would fail due to that. At least not without saying
anything.
- Bad implementation of true colour v_get_pixel.
I found out yesterday that GEMBench does not understand how that
function works under true colour modes (and was thus able to fix a
minor problem (well, the fault turned out to be GEMBench's, but I
modified the behaviour of fVDI a bit to make the result more useful)
that had been bugging me for years :-), and it is sometimes used to
figure out the pixel format for such modes.

Did I miss anything?

All the above possibilities should be fixable without a whole lot of work.

I just put up quite a number of auctions. I haven't used my Atari 520ST in quite a while, so I figure I'll pass on my stuff to next enthusiast. All items are on auction at Ebay.

The date listed is the end date of the individual auction.

If you're wondering what the TEAC drives are doing in the list: I used them to replace the original Atari disk drives that failed on me. The Colecovision power supply is an exact match for the 'standard' floppy drive power supply.

We still have not listed all we have in our shop. We are not sure if there is still a market for, as the AMIGA for example is much stronger in games. Probably ATARI ST users are more working on their machines than playing. Am I right?

Hi Djordje,

>TOSBox supports higher resolutions too, but they have to be configured
>beforehand in the .INI file. TOSBox is not as compatible as Gemulator.

I did get higher resolutions, and very nice too but the main app
I wanted to run (Scooter PCB) didn't work. It starts to load
then returns back to the desktop. I'm surprissed as it runs on
Falcons, and apparantly Magic for PC and Mac. I might try
TOSBOX then.

847. Steem / Gemultaror Explorer

Newsgroup: comp.sys.atari.st
Date: 2002-07-11 13:01:22 UTC
From: The Happy Hippy <the.happy.hippy@ntlworld.com>
Message-ID: <hkfX8.2302$PB4.93902@news8-gui.server.ntli.net>
Source record: 33605

Hi, I'm new to the world of Atari (and at 40-something, perhaps a little late in catching the buzz), so please accept my apologies if this is a really stupid question, but I couldn't find an answer reading the Help/FAQ or through Google etc ...

I have Gemulator Explorer 2.03 which will read my Atari ST disks ok, and save them as disk images (*.cd, *.dsk and *.im*).

I have the Steem emulator, and a downloaded xyzzy.stt program in my "Atari Hard Disk" folder runs fine.

How do I convert my disk images into something Steem will understand and execute ? Or, am I doing this all wrong ?

Also, what's the best way of doing cross-development on a PC to create programs/disks which run on a real Atari 520 STE ?

I don't want to buy any software so I'm expecting I'll have to use ST BASIC. Any other free compilers available ?

Many thanks in anticipation of any help someone may have.

848. Re: Resolutionchange...

From: Raoul Teulings <rt@xs4all.nl>
Date: Wed, 10 Jul 2002 18:20:42 +0200

Hi Raoul,

>Does anyone know how to change to B/W resolution with a NOVAGraphic
>card. I know that you can make your own rez's with an according program
>but has someone ever done that? To my TT there's a IYama 17" monitor
>attached. Most of my rez's are in 70Hz...

On the NOVA installation disk there's a folder called "MONITOR" which
contains lots of pre-configured resolutions. Both the "NEC_4GS.BIB and
BIS80MHZ.BIB" files are suitable for your Iyama monitor. Rename one of
the files to STA_VDI.BIB and put it in the AUTO folder, but do make a
backup of your original file for safety sake...
You can add/delete resolutions following Grzegorz advice but I don't
think this will be necessary since both drivers cover almost any
resolution ranging between 600*400 all the way up to 1600*1200.
IIRC there's even a 320*200 monochrome resolution available....

In case the MONITOR-folder or the two files aren't on the install disk,
don't worry.... they should be in your mailbox now :-)

Cheers from Belgium
Dennis

>>seems to ignore these when you assign shortcuts to them :-(

Hi Djordje!

Actually, I was wrong in the above: After looking at the RSC in a hex editor, I found that Interface had inserted a NULL (presumably) at the end of the original length before extending the menu entries with spaces automatically to match the longest menu item. PixArt was appending the shortcuts at these NULLs, which is why they didn't line up. The NULLs didn't show in Interface, of course. Derryck lined the shortcuts up by increasing the number of trailing spaces for all entries to match the original German, so Interface didn't have to extend them.

>One has to fiddle a bit with some options of Interface (concerning
>optimization of menu-items lengths) in order to make it do what
>one would like in this case, and not what Interface itself thinks
>should be done.

What kind of fiddling do you mean? Or is it just making sure that all the entries of a menu are padded out to the same length?

Regards, /Peter/

Please don't use ST BASIC. It's no good. (If anyone doesn't agree, let us
know). I think GfaBasic 2.x is free and GfaBasic 3.5 or 3.6 is Shareware
or commercial for not so money (I don't know exactly).

There are also free C compilers available. And on the SpareMiNT site
you'll find a special cross-compiler section
(http://sparemint.atari.org)

Martin Tarenskeen

I used ResourceMaster as it happens - the beta 3.20 that Armin Diedering sent
to D&D as we were then to have its resource file translated.

<grumble>
Well it got translated, but we were never given the full version so the
English resource file remains for local use only (and still needs tidying if
it is to see the light of day.
</grumble>

Cheers

Derryck

859. Devpac 3 & Nostalgia

Newsgroup: comp.sys.atari.st
Date: 2002-07-12 14:43:30 UTC
From: Peter Kienle <pkienle@acmerecords.com>
Message-ID: <pkienle-FEBBBF.10433012072002@news.indiana.edu>
Source record: 33617

Hi everybody

I still have my MegaSTe setup and in great working shape. But for lack of space it's set up so high that I have to stand up to type...

Anyway, I have been trying to run some of the ST key apps in Nostalgia 1.1 on the Mac because the Mac is setup for easy typing. But I have a few questions somebody might have an answer to:

1) With the exact same install as I run it on the ST (TOS 2.5) in Nostalgia Devpac3 doesn't find it's assembler (GEN.TTP) and monitor (MON.PRG). I have tried modifying the .INF file and even looked into the Devpac3 code to see if I can find a solution.

2) Also Pagestream 2.2 doesn't run properly. I guess it also can't locate several of the files it needs. Even resetting the paths correctly doesn't help.

3) Has anybody been able to install two HD partitions in Nostalgia. At least the docs point out that it's possible and I had an email exchange with the author who says so but I can't get it to work.

Thanks

Peter Kienle

From: Lannie Schafroth <lannie_schafroth@hotmail.com>
Message-ID: <3d2f2454_18@news.teranews.com>
Source record: 33619

I am a old Atari user who only had a 1040ST and regular old 1.04 TOS. I've never used any other desktop except NeoDesk.

I am using Aranym 0.1.7 for windows.

Does anyone have a hardrive image for it with FreeMint and all the eye candy installed? I would like to browse the Internet with it and try all the latest software for internet use.

Is ARAnyM not far enough along to try this?

Lannie

PS I wouldn't begin to know how to install all this.

862. StringServer

Newsgroup: comp.sys.atari.st
Date: 2002-07-12 19:14:09 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0207122100430.77-100000@easymint>
Source record: 33620

Hi,

I'm trying to install and configure StringServer. Some nice things I can already do, like starting CAB by selecting and clicking on a weblink in an e-mail or news message from pine in a TOSWIN2 window :-)

I haven't figured out everything yet however. Strange things happen, or things don't happen as I expect once in a while.
For example: I sometimes see that StringServer is started more than one time. If I list the running processes with "ps" in my shell, I can see both "STRNGSRV" and "strngsrv". Is this normal ?

I haven't managed to use StringServer as a replacement for THiNG's installed applications. Like clicking on a *.HTM file to start CAB on the desktop. Things like that. With THiNG I can do this of course, but StringServer has some nice extra tricks that I would like to use.

Any experienced and happy StringServer users that can give me some hints and tips for first time users ? (I will also read the HYP again, but human help is always welcome)

869. The restoration of Atari...

Newsgroup: comp.sys.atari.st
Date: 2002-07-13 01:43:02 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <3d2f822a$1_2@corp.newsgroups.com>
Source record: 33627

Just for the sake of humoring me and/or seeing if such an idea is even remotely possible, would anyone here mind doing a short 30 second "spot" animation along the following guidelines:

1) Dark (black) screen; the only sound is the distant high-pitched sound of someone having flatlined.
2) Suddenly, "Beep!" (very faint image of the Atari logo in grey); more flatline. Atari logo fades to darkness.
3) Another beep. (Atari logo reappears, more clearly now, and with a hint of color). Flatline.
4) The beeps get closer together and louder, and as the do, the Atari logo grows clearer and more colorful.
5) The beeps are now backed by a strong heartbeat and the Atari logo appears steady in all of it's colorful glory.
6) The words and narration of "We're back!" appear.

Don't ask me why I'm back clamoring about this crap again. It's probably the fact that Amiga, Inc. is alive (with AmigaOne computers and AmigaOS 4 in the wings) and Atari Corp. is dead and gone that has me all bothered. Maybe it's the fact that *BECAUSE* Amiga, Inc. is back, I figure "WHY THE HELL CAN'T ATARI COME BACK?" There's really NO reason!

I will present this animation to Infogrames along with a serious, well-detailed business plan. The worst they can do is say "No."

Needless to say, I figure this animation would be spread via the Internet, not shown on TV (too expensive).

If they say "Yes.", here is a snippet of what the preliminary gameplan is:

You've seen those cheap little handheld touchpad thingies that hold dates and Email addresses and such? They're usually well under $50 and many times are $20 or so. There was one in grey that made me REALLY want it (just as a mock idea for what I'm thinking about). There was one for only $11 that even had a QWERTY keypad!

Imagine if such a device were "evolvable" (feature upgradable). Suppose there were about 5 or 6 different ones (maybe more), with different functions. But, you could "evolve" yours to have the features that someone else's had (shared evolution), just by putting them together (I'm thinking IR communication would be neat, but an interface cable could be nice too). You could also do a 'straight across trade' of functions (you get theirs and they get yours) You can also download new features/games from the special website when you had maximized your "Evolutionary Cycle" (obtained the features of all the different models). It's a tool! It's a toy! It's... BOTH!

And it's from Atari!

This would be, but the first step, towards restoring Atari as a hardware company and getting it out of the utterly meaningless "labelville", as it is today.

Jared

I have a bunch of Atari odds and ends up for auction on Ebay. I have a ton more of Atari STuff to auction off. Im thinning down my collection.

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewSellersOtherItems&userid=atari%40qnet.com&include=0&since=-1&sort=3&rows=25

Thanks,

Don

874. StringServer (more)

Newsgroup: comp.sys.atari.st
Date: 2002-07-13 09:56:17 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0207131145490.59-100000@easymint>
Source record: 33632

My StringServer configuration is making progress. I have now succeeded in doing this trick: when I doubleclick on a *.htm(l) file on my desktop CAB is used to view the file, but when I hold the Shift key when doing this Highwire is used instead. Pretty cool :-)

One problem I haven't solved yet. If I install StringServer as an application to open all files that have not been assigned to another program, using "*" as a mask in THiNG, this works but: I cannot start any executables directly anymore from the desktop. Apparently no exception is made for files ending with .PRG, or .APP, etc. ???

How do I achieve that only filenames of non-executables are processed by StringServer ?

Martin Tarenskeen

Has anyone made it work? I have installed TRAPPER, MWHEEL and MWHL-SER
in AUTO folder, but the wheel mouse does not seem to work at all.
I have tried both Modem 1 and Modem 2 ports (I use Atari TT), I have
ensured the correct port is set in MWHL-SER.PRG file, but nothing happened.

I do have HSModem 07 installed.

The wheel serial mouse is OK, it works with other serial mouse drivers
(but of course the wheel itself does not).

What's going on?

In reply to my own question:
I have installed StringServer to SHOW instead of OPEN files with a * mask.
Now everything works as it should. It's great!

Is StringServer still being developed ? If I read the docs some ideas have
not been finished/implemented in the version I have. (from an archive
named SSPB3110.LZH)

I finally found some sparetime to play around with Stringserver. I'm not
so far progressed as you but it looks cool indeed.
If enough people start using this very usefull app, maybe the programmer
(Ozk) will be motivated to work on it.

CU,
Martin

Hi Jared,

>This would be, but the first step, towards restoring Atari as a hardware
>company and getting it out of the utterly meaningless "labelville", as it
>is today.

So you still haven't give up your dream to revive Atari ? Well, while you
were dreaming someone else has beat you to it...
Take a look at http://www.ifone.com
The US-based firm Jakks Pacific is going to release an 8bit game console
on which 10 Atari game classics are pre-installed. The unit has a retail
price of only $20.
More important then that console are the people behind Jakks Pacific....
wanna take an educated guess? :-)

>I will present this animation to Infogrames

You've made a fool of yourself once at Infogrames, don't do it again !!!
You do realise I hope that when it comes down to producing animations
Infogrames is one of the major players? Whatever it is you plan to show
them, they have the knowledge and capabilities to produce something which
is 1000 times better...

>along with a serious, well-detailed business plan. The worst they can do
>is say "No."

Oh boy....
IIRC your previous "detailed business plan" was one big joke. Before a
business plan can be labeled "serious", it needs the blessings of an
experienced accountant and the bank(s). Are you trying to tell us that you
actually found a bank that is willing to finance your dreams ?

Cheers from Belgium
Dennis

Hell Don,

It is nice that you have things working. I did not know Gemulator 2000 was
now free. Where did you pick it up?

Hell Mark,

I think I had the same problem if I understand you correctly. I installed the Link 2 in my STe. A friend of mine made me the SCSI cable I needed. I turned everything on, the Link 2's light came on, but the hard drive would not boot up. It was not being recognized by the Link 2. It turned out the problem was the cable itself. You might check the connections. My friend just made me a new cable. It seems the first time the SCSI connectors were installed alittle mis-aligned.

Indeed, keep up the work. But do consider adjusting your usenet
advertising methods, which at times are quite annoying. In the long run
I am sure you'll be better off by listening to what people in general
think about them.

Nevertheless, good luck with your business :)

Old games for cell phones? Yawn! When will retro ever die?

> The US-based firm Jakks Pacific is going to release an 8bit game console
> on which 10 Atari game classics are pre-installed. The unit has a retail
> price of only $20.

While "Adventure" has me a tad excited, it's easy enough to get a 2600
emulator for my PC, download the "Adventure" ROM and play it for free!
Again, I say... when will retro ever die?

> More important then that console are the people behind Jakks Pacific....
> wanna take an educated guess? :-)

I'm not seeing the Tramiels. Looks like there *might* be a Be, Inc. member
in there (if the name matches). Please, tell me who's backing this company?
ex-Sega/Atari employees? People from Commodore? Come on... TELL ME!!!

> You've made a fool of yourself once at Infogrames, don't do it again !!!

What fool? The only reply I got from them was telling me they weren't
interested in doing what I was suggesting at the present time. And, as
you'll continue to see, all they're really doing, time and time again is
EXPLOITING the Atari name and licensing old games over and over and over
again. And, AGAIN, I say... when will retro ever die?

> You do realise I hope that when it comes down to producing animations
> Infogrames is one of the major players?

Oh, goody! I'll have THEM do it for me, then! :-)

> Whatever it is you plan to show
> them, they have the knowledge and capabilities to produce something which
> is 1000 times better...

And yet they've NEVER done it to this day. If they CAN, why DON'T they?

> Oh boy....
> IIRC your previous "detailed business plan" was one big joke. Before a

> business plan can be labeled "serious", it needs the blessings of an
> experienced accountant and the bank(s). Are you trying to tell us that you
> actually found a bank that is willing to finance your dreams ?

All that would need to happen is for Infogrames to say "Ok" to my Nutty Professor idea and the ball would be rolling. I would finance the "New Atari" (hardware divisions) from my own pocketbook and the interest of others like me. I mean, what I propose is a LOT more sensible that licensing some 20+ year old games and putting them in a cheap game system and try to sell them as new... my goodness, what are they THINKING? Like I'm gonna go out and buy one of these retro pieces of garbage? Pah!

I'm talking NEW devices. New ideas. And, most importantly, NEW COMPUTERS!!!

Would you buy an Atari Lynx II (was one ever made or prototyped?) if it were suddenly available with games to boot? Would you buy an Atari palmheld device if it were available? Would you buy a new Atari computer (non-x86), if it were available?

I'm not talking trying to sell people on old retro games that died a billion years ago. I'm suggesting the revival of a brandname and present new products with it!

Here's a question:

What is the FIRST thing YOU would do if Infogrames handed you a license to the Atari brandname and said "Do something with this, but do it justice."

Would you honestly just hand it back to them and say "No thanks" or would you try to bring Atari back into the limelight in a big way, regardless how many tiny steps you needed to take to get there?

"Atari", as it appears on game boxes today, means about as much as to me as "Top Ramen" on a bag of chinese noodles. It garners about an atom's worth of interest to me today. Only the game itself would matters, not the name on it, today. But I come from a day when brandname loyalty was the hot thing. When Atari vs. Colecovision and Atari vs. Commodore Amiga and Atari vs. Mattel Intellivision were the picks of the day.

To this day, "Kawasaki" means just as much to me as it ever did. I *love* Kawasaki! Ever since the first KX80 a friend bought in the 70's. Sega has lost a lot of it's shine in my mind since dropping out of the hardware business... but they still make awesome games. "Panzer Dragoon: Orta" is coming for Xbox! Whoo-hoo!

I am and always will be a brand-loyalist. But only as long as the brand lives on, doing what it did and does best since the beginning. If Kawasaki stopped making motorcycles and jetskis and made chinese noodles, I'd stop caring about them.

Atari has ALWAYS, but *A L W A Y S* been a hardware company, from the very beginning! Atari Pong (arcade game; hardware) and a billion other arcade releases too numerous to mention, Atari pinball machines (hardware), Atari

2600, 5200, 7800, Lynx, and Jaguar (home game systems; hardware), Atari 400, 800, etc. (8-bit home computers; hardware), Atari 520ST, 1040ST, MegaST 2/4, STe, TT, and Falcon030 (16/32-bit home computers; hardware)...

Yes, they made software (as AtariSoft for the Apple II, C64, Colecovision, and Intellivision), but they have *ALWAYS* been a hardware company... until now. Now, they don't exist in the arcades. They don't exist in hardware. They exist *ONLY* as a sad rememberance of what the name *USED* to mean... tacked alongside other brandnames on the box of a game title or two.

Remember... "Gauntlet: Legends"? It was by Atari Games (under Midway which is/was under Williams). Look on the box for the PS/2 or Xbox version. Just TRY and find the word/name "Atari" anywhere in the fine print! It's not there as far as I can tell!

What a blasted, friggin' shame... the "Atari" name, literally obliterated in every way, except to be tacked onto game boxes as a sales tactic!

I wonder how much profit it's earning Infogrames that way?

Jared

Yes.

And if you were able to google for, say '"Atari ST" IDE interface', then
you would, too. It's the first hit:

http://members.tripod.com/~piters/atari/astide.htm

Try the different version here http://www.joogn.de that doesn't
need GALs. Keep the wires shorter on IDE lead as it isn't
buffered. So, under 30cm would be best.

I've had this installed since the day Ozk told me about it on IRC.
aIRC will work with this cool tool for web urls, ftp, email and such while
on IRC, just click them! Well assuming you configure the tool correctly.

I TOLD YOU SO!!!

But... NOOOO, you and everyone else wouldn't believe me. I'm just a little know-nothing enthusiast fool trying to restart Atari, to everyone here. Well, big dreams make for even bigger success stories. I just need to get Infogrames to say "Ok" and we can get this little show on the road...

Did they say anything else about my letter, to you? how long ago did you do this research?

Glad you finally found out I was telling the truth. I told you I deleted that message to them. Can't very well reinvent the message verbatim, much as I woulda liked to... and didn't want to even try to go into all the details. Would've just been laughed at, most probably.

Jared

Hi Michael, I did try google I always do first, I did see that page a few
times though I can't program GAL IC's which makes the design a bit useless.
I should have stated just a plain logic design, im sure one can be done
without the need for GAL's :-\

Live Plus
Sequencer
By Harold Plontke
Demo Version

Not long ago, I was able to make contact with a certain Harold Plontke and asked him about his sequencer program called Live Plus. Unfortunatly, he could not release it to me, as another company held the rights. However, he worked out a very usable Demo version which is now available. This demo version, while it cannot save in "song" format, can save in standard MIDI file format, thus making this excellent application a very usable arsonal in the Atari range of MIDI tools.

Working with Live Plus is almost like working with Cubase. It uses the same keyboard shortcuts for the Transport bar. It has a set of tools to work with in it's "keyedit" mode.It also has the familiar arrange screen in which you can move around patterns, name them and assign MIDI functions, just like in Cubase. Live Plus also has an interesting help system. At the bottom of the screen are indicators of what the functions are when you move the mouse curser over a certain function in the screen. You can also change the language from German to English.(by clicking on the "language" notice in the field)

Or...if you have an STE you could simply buy the IDEal interface ready made
and/or already installed on an STE.

Hello,

Get yourself a Link 2 host adapter and you will be abld to connect any SCSI HD up to the ST. I use one to connect a SCSI HD and CD drive to my STe.

Almost any drive. Remember that a few devices require initiator
identification, which is something only the LINK96/97 adapters provide.

Sorry, I may have been a bit rude, but too many people post without
doing any research of their own first.

There are several simple circuits for GAL programming around. One od the
most flexible designs is Manfred Winterhoff's GALBlast, at

http://www.geocities.com/ResearchTriangle/Forum/8070/galblast.htm

You might even get away with his "Minimum effort GAL programming", at

http://www.geocities.com/ResearchTriangle/Forum/8070/program.htm,

though.

Regards,
Michael

You know what... this is entirely too hilarious...

Everything I wanted for Atari is *HAPPENING* with the AmigaOne!

1) The Amiga is back as a NEW Amiga, not some legacy-extension (Atari probably never will come back and clones are nothing but legacy extensions)
2) The AO uses a PowerPC processor (I wanted that for the New Atari Computers)
3) Software support is brewing... games and applications are coming!
4) AmigaOS 4 looks awesome!

The more I think about it, the more I realize... AmigaOne means just that... Amiga WON!

Dead for about a decade, but finally revived. Oh, I can just *TASTE* the 80's thrill coming back already! Except this time, it ain't gonna be no Fuji symbol I'm excited about... it's gonna be a Boing ball and checkmark symbol! Yee-haw!

Enjoy yourselves... I'm done beating this dead horse, called Atari. The past is coming back to life in a whole new way... the AmigaOne way!

See for yourself, tis true! Go here for a start:

http://www.amiga.com

I was planning to build that one, but as you say there is no info just the
drawing. If you look closely enough 2 of the gates are labeld up twice with
the same IC, It was something like A,A,C,D, hence no B gate but 2 A's, thats
one mistake even before building the thing. Its a lot of work to build the
thing when there is no way of telling if it will work or not.

Hi !

Thanks to Didier Briel (TransAction), the documentation for LDV (using & programming)
is now available at:
http://vision.atari.org/vision.doc/english/ldv.htm

Have a look and follow the LDV development kit link !

> 1) The Amiga is back as a NEW Amiga, not some legacy-extension

Wrong. It's simply an new computer with modified AmigaOS for backward compatibility with clean Amiga OS software -> it's exactly same as Medusa, Hades, Eagle, Milan, etc..
So better to say: Amiga has finally a clone since TOS users have them several already for a long time.

> 2) The AO uses a PowerPC processor

Yes, and thanks it it's predetermined to be allways a slow, expensive and hardly upgradable machine.

> 3) Software support is brewing... games and applications are coming!

Dream on ! There is no market for that.

> 4) AmigaOS 4 looks awesome!

AmigaOS 4 is the same old crap as 10 years old OS 3.xx. In fact it is only a slightly modified OS 3.xx rewritten for PPC.

> The more I think about it, the more I realize... AmigaOne means just that...
> Amiga WON!

Oh boy, get yourself a cold bath. The real Amiga died togehter with the model A500
many years ago. I had one that time. I spent a thousands hours with awesome games like turrican 1/2, Apidia, Dune II or Perihelion. I did also many tunes with Protracker 2.3 and watched a bunch of demos. That was the real Amiga spirit, the games, the demos, the fantastic tunes from Moby, Jester, Chris Huelsbeck and many others, the blured picture on the TV screen, the strange souns from a flopy drive durning disk operations, the broken joysticks... It wasn't an Amiga OS, the most users even didn't know how the AmigaOS looks like, because they used it only as a game console.
I want to say, that is imposible to do a new Amiga, same as is imposible to do a new ZX spectrum or C64. Yes, you can design a new computer with the new OS based on the old AmigaOS for some kind of backward compatibility and then call it Amiga, but is it an Amiga then ? Not for me. I loved my A500, but the Amiga OS was ugly, slow and unfrindly for me.

The name is being presented on TV at present, I agree that the name is worth more than that but they are trying, testing the water.

For what it is worth, I thought it was a good idea. However, there needs to be some products before the name is advertised. Not sure why everyone gives you such a hard time.

I had a similar problem on a TT, for me simply getting another PSU and running some things on one and some things on the other cleaned it up. Try this as a simple solution, however I can not help a proper fix.

>is used to view the file, but when I hold the Shift key when doing this
>Highwire is used instead. Pretty cool :-)

Which version are you using Martin? Mine's 1.07 according to the "About..."
menu item.

Thanks to Sean Barbieri (are you still around Sean?) I can print messages from
within Emailer if I click them with the [Shift] key pressed, but I can't
persuade Idealist (which is the app doing the actual printing) to accept a
command line argument from StringServer to use a different config file.

Anyone?

Cheers

Derryck

927. Re: STOS Basic - Screen as a String

Newsgroup: comp.sys.atari.st
Date: 2002-07-15 14:52:43 UTC
From: Elliot <stuff@recycledsteel.co.uk>
Message-ID: <1026744765.12853.0.nnrp-08.3e31118f@news.demon.co.uk>
Source record: 33537
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hmmm, it has been some time but this may help, it is just an extension on what was said.

Think about the fact that a screen is exactly 32000 bytes, I think the rest is just palette on a PI1 and palette plus colour rotation/change on a NEO. Assuming each screen has the same palette then it is not a problem as it can simply be loaded before you start displaying, if not you can mask them off and put them into another bank and change the colour palette with each new frame.

The point being, if this is done then you only need to change the screen address each VBL and not to have to copy the screen into the LOGIC area, it can simply be replaced with;

```
reserve as data 10,32000*5
load "pic1.pi1",start(10)
load "pic2.pi1",start(10)+32000
load "pic3.pi1",start(10)+32000*2
load "pic4.pi1",start(10)+32000*3
load "pic5.pi1",start(10)+32000*4

for PICNUM = 0 to 4
for FPS = 1 to 5
wait VBL
next FPS
physics = start(10)+(32000*PICNUM)
next PICNUM
```

This should produce a simple animation at 5 FPS, it will only last a second with 5 frames (increase the FPS loop to make it last longer). I can not find my STOS book but I think that you need to put a SCREEN SWAP command or something similar after the "next FPS" but you will have to look into that yourself.

The only advantage this has is that the COPY command is removed, this will free a massive amount of CPU time. The only problem with this is that you may have to a line the BANK to 16bytes (I think) as the STFM Shifter is not that great, if the screen looks very wrong then this is the problem - can anyone help with this?

32K images by 30 odd images will be a lot of RAM (well 960K), you will be lucky to get it into a 1mb machine. As the other chap mentioned, STOS supports compressed images, a 32K image will go down to 4-5K or so, this means that you should be able to go from 30 frames to 210, at 12 FPS you will get 17 seconds or so on a 1mb machine. I do not want to go into that

any more as I can not remember it, there is also a lot of optimising that can be done in all of this too, I think you can compress just sections too so you can change your screen to say 160x120.

I have lots of STOS code about with Demos in mind, none of it released but you may be interested. I also spent much time optimising code in STOS and there is lots that can be done. Mail me if you want to look over stuff (stuff@recycledsteel.co.uk).

If you're talking about the ConfigSS program, that's my Public Beta
version too. The StringServer program is v1.0 beta.

Idealist is something I haven't tried yet. I'm using LPR.APP that came
with an old Multitos distribution I think. I could use something more
advanced, but equally simple to use. I'm looking for a print program that
lets me print both textfiles with dos/tos style end-of-lines (CR+LF) and
unix-style textfiles (LF only). Can Idealist do this (and more)

Mark why words, Infogrames will not sell Atari brand computers unless they wish to go out of business. That era is over and done.

> For what it is worth, I thought it was a good idea. However, there needs to
> be some products before the name is advertised. Not sure why everyone gives
> you such a hard time.

Alot of people here have the same dream, but it's just a dream. They do not continually post rediculous ideas to this group. I could probably name about 100 people whom I and others consider 'movers and shakers' from the past and present on this platform. If one of those people had an idea I'd listen, reputation means something. However Jared is not on this list, he is a nobody, just someone with to much free time, and no real grasp on the magnitude of what he proposes.

Frankly, I think he should take his silly ideas to comp.sys.atari.announce ...

It's often a policy not to give out employee info or ex-employee info such as address and telephone number. They could of at least gave a name so you could do some google searches.

I basically have a ton of SCSI drives and enclosures but no way of me hooking them up on the STE. Ideally I would like some SCSI adapter like Link but even a Megafile 44 would be great. Also any other HDs are fine. I don't care if it's 10MBs, as long as it's bigger than a 720K floppy and works on my STE. So Supras, Megafiles, SHs are welcome. I am aware that I could get a new Link 2 for 90 some bux plus shipping. Too rich for me... I am in North Bay, Ontario, Canada.

Joshua.

>always the downside with
>pastage - doubles the price of everything....

Well, that would be a very cheap Falcon if the postage doubled the price :-)) (But I know what you mean.)

All rather academic now I'm afraid as the machine is already promised to someone else. However, the monitor (which may be faulty), the copy of Cubase 3.1 (not audio) and the Roland SC55 sound canvas are still available and open to offers.

BTW, Peterborough is about 80 miles due North of London, just off the A1, and the first stop for many Intercity trains going to those wild Northern lands :-))

All the best

Paul

Hi!

I thought I'd report to the group about my solution for transferring files between a PC and my Falcon: Adaptec market a 'USBXchange' for 65 UKP that allows one SCSI drive to be connected to a Windows XP computer (more to some earlier versions). After I downloaded and installed new drivers (the package as bought was obviously too old for XP) I connected my SyQuest EZ135 to the PC, and could download to it (or copy files to it) without problems.

Originally I was going to move the SyQuest between the PC and my Falcon's SCSI chain, but I have since bought a second drive so one can stay attached to each machine and I only have to move the cartridges across.

Seeing the speed at which the PC renders some image-heavy websites is a real eye-opener. For instance a couple of the last MyAtari articles heavy with graphics took nearly 5 minutes to load on my Falcon, whereas they came up instantly on the PC. Same is true with some PDFs.

So in future I will do my web browsing on the PC, specially as it's on a much cheaper tarrif, and transfer any Atari downloads etc. on the SyQuest.

Regards, /Peter/

I thought the Windows versions weren't as uptodate as the Linux
one? Is it optimised well, I only have Pentium 1 233MMX, Steem
wouldn't work at acceptable speed. Gemulator benchmarked though
at 3 times faster than a Falcon but won't run this particular
piece of software. I basically need ST/TT speed.

AmigaOne is not a dream but reality. Seems that there is demand for
a new Amiga over a new ST. Amiga owners came through and made it
happen while ST fugi users sat on there duffs.

So not a veep of Taf? Been disbanded? or lost ambition?

There seems to be a stench creeping down south, a couple hundred miles
from the up north border. Did your garbage collectors go on strike or
what?

sinclap!

Well, I've sorted this problem by using LPR.PRG (which I found in the Jinnee
"EXTRAS" folder. I'm pretty sure that we'd not been able to get this working in
the past - but it's fine now :-) MagiC's PRINT.TTP also works, but only in a
default font that's too big.

>lets me print both textfiles with dos/tos style end-of-lines (CR+LF) and

I don't really know, I can't see anything about it after a brief look but you
could try it :-)

Thanks for making me look into this again, I'd given up!

Cheers

Derryck

Bummer dude, i wish i knew you were doing this, i got a SCSI card for my windows box for half that cost, allows 7 SCSI devices to be connected, so I'm able to share my external hard drives, SCSI DAT and ZIP drives between platforms and leave my USB ports free.

Yes, those emulators are like that- e.g. I could not get DynaCADD to work in Gemulator, but in TOSbox it (at least) runs (for a while before freezing) and I remember in Pacifist it worked quite ok. AES4.1 did not like Gemulator either, but worked nice in TOSbox. On the other hand, Prospero fortran worked fine in Gemulator, but in TOSbox compilation of anything involving floating-point numbers caused a crash.

> share my cable internet?

Insnï¿½t an network connector. Itï¿½s called "LAN" and it mean "serial port"
Must be an joke or an never developed chance to made "apple talk" :->

You can use this port as second serial port.

> 2)does anyone know where to find drivers voor a HP DJ850 for SpeedoGdos and
> some fonts for Speedo

No idea. Development of Speedo stops jears ago.

Same as with NVDI 5.03, last chance to use an HP DJ660c as example with
an real old HP550c driver :/

It works, but itï¿½s makes no sense to ask for later drivers ;(

Have a look to www.nvdi.de ad watch the latest update.

I took a look at it and it looks ok for me to build, though on the drawing
what are the numbers in a circle for ? I see you numbered all the IC pins,
Blitter pins, Address number etc, though I can't work out what the circled
ones are for ? I also assume the datalines are connected straight to the ST
bus ?

Thanks,
chris

AFAIK, the windows versions are synced with the official relases. Anyway,
the windoze versions are fully usable.

I think that on your machine the Aranym should be at least as fast as an
plain Falcon with FPU and graphics card.

956. TWSM/2 under XaAES?

Newsgroup: comp.sys.atari.st
Date: 2002-07-16 17:14:30 UTC
From: guillaumed@atari.org
Message-ID: <2eb10038.0207160914.629ee542@posting.google.com>
Source record: 33564

Has anyone got TWSM 2.3 to work under XaAES?

Here it *runs*, but when I click on the workspace's reduced images, workspaces do not switch (well no window or icon disappear from the screen anyway).

I have not changed my TWSM configuration for ages and I got it to work under AES 4.1 (IIRC). To Henk: Does it use some dirty tricks and do I have to get used to it not working? I hope not... :-(

BTW I tried under XaAES versions 0.951, 0.950, 0.943 and certainly some earlier versions... And yes I am registered for TWSM.

Thanks by advance for any help.

But it *is* stated there that NVDI 5.03 supports HP DeskJet 850! ;-)
And when I click on INSTPRN.PRG, there is "HP DeskJet 850 Color"
option available, with 600 DPI max. resolution supported. I have NVDI 5.03
(NVDI 5.02 plus free 5.03 upgrade).

BTW you should consider leaving SpeedoGDOS and buying NVDI. It is *much*
faster and much more compatible (I never made SpeedoGDOS to work properly
with Papyrus word processor....) NVDI is much better, and nearly 100%
SpeedoGDOS compatible. It also offers more useful functions.

I have a TWSM version on my second hand MILAN. Never tried it (not even with
N.Aes) I actually do not know if the former owner ever used it.

But I will try it out. A welcome opportunity to find bugs.

959. HELP WITH COMP.SYS.ATARI.ST FAQ!!!!

Newsgroup: comp.sys.atari.st
Date: 2002-07-17 00:26:12 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1026840814-397043AEicMi@williams-net.com>
Source record: 33567

Everyone,
For some time now I have been pondering the possibility of putting together a FAQ newsletter that I would post once every 2 weeks or so. My question are as follows:

1) Obviously, I cant get everything by myself. So I need your guys help with this matter. Any Atari sites that you guys thought very interesting or worthy of being on a FAQ. Send it to my E-mail address which is correct when you hit ANSWER in EMailer.

2) Any FAQ question that you would like to be put into this FAQ so people can look at the answers before posting or inquire about information from certian experts with those type of questions.

3) List of VENDORS that still support our beloved computers. I know that this maybe a sticky subject with some people but this is not meant as an advertisement. But and informative FAQ and without these people that still sell ATARI hardware and software where would we be??? Remember, we cannot get everything for FREE and I think that is what some people expect out of the Atari market now. Remember, if we do not support the upcoming XTOS machine and the ATSF the Atari following may as well roll over and DIE at that point!!!

4) Any other information about the ST/Falcon/TT/ and Clones that you might want included. Let me know!!!! Just send me an e-mail with a link or question and the answer. I will do my best to add it to my COMP.SYS.ATARI.ST.TXT file!!!!

Think of it this way people. If we do not have people out there like me who love there Atari computers. And figure there is absolutely NO market for Atari anymore. We will have lost to BILL GATES. I have never owned a PC and am 100 percent ATARI. I am considering getting a APPLE PowerMac so I can network my Falcon to broadband Internet connection. But anyways we need to support the Software houses still available to us, the upcoming CLONES like XTOS and the ATSF where ever possible!!! I will be posting a FAQ in the upcoming weeks as soon as I feel it is fit for

some sort of criticism!!!!

Thanks,
Carey Christenson

>
> sinclap!

Hey, Sinclap... finally someone who agrees with me whole-heartedly! It's actually refreshing!

[rant mode in activated...]

Atari is dead. It just barely lives on, in name only, as a sad reminder just how easy it is to drag a once-famous company through the mud, into the gutter, over hot coals, and then neatly dump it into a BearCat chipper-shredder! It's shredded corpse finally deposited onto a nice smoldering pile of steer manure, to ferment awhile.

Meanwhile, Commodore was destroyed, yet the vision and dream of the Amiga kept going and going and going and GOING! Not even the death of Commodore or Escom could stop it! And Gateway gave it up and it STILL lived on! An on and on and ON!

Until this day and time, when Amiga, Inc was REBORN (remember, they existed before Commodore got them)! And the AmigaOne G3-SE exists! And AmigaOS 4 is here! And the AmigaOne XE (upgradable processor!) is being shown in photos. A finished motherboard (with processor card), no less!

Tis a great day to be an EX-Atarian. We will soon have the AmigaOne and it's by-products probably by no later than the end of the year (solely dependant as to when AmigaOS 4 is available to end-users). New technology. New software. Company support. Try getting all that on your Atari clones. Even the Atari Coldfire Project is a joke... you think it's really going to *revive* the market? Pah! Get it through your heads...

THERE... IS... NO... COMPANY... BEHIND... IT!

Clone manufacturers don't count. Only if someone were to revive *Atari* as a hardware division again (since Atari has ALWAYS,
A L W A Y S, *A * L * W * A * Y * S * been a *HARDWARE* company), would any such effort of a new Atari computer ever even have the slightest CHANCE of succeeding!

But...

No one can accept that.
No one can see that.
No one can understand that!

And...

No one will ever DO that!

Because Atari is dead and no one cares enough to do everything in their power (and beyond) to try and change history, regardless how utterly stupid it was for Atari to have been KILLED BY THE SAME DICKHEAD, BULLCOCK-SUCKING FUCKERS THAT SAVED IT ONLY 10 YEARS EARLIER!!!

A R R R R R R G H !!!!

Anyone have any FRICKEN IDEA WHERE ATARI (and Atari computers) COULD BE TODAY, IF IT WASN'T FOR THAT?!?

(Oh, probably about where Apple and their computers are today, I would guess...)

Eh-hmm!

[rant mode deactivated...]

Jared

Hi Chris...I think that you want to do this is great.
I have a FAQ page as well...and we also have the Great ATARI-QUICK FAQ
which answers most of your topics already. There is also Hallvards FAQ
Pages .

The links are here:

http://tamw.atari-users.net/download.htm

I usually direct people to this Faq if they want to know how to
download Atari software, transfer MIDI files, as well as Links to the
other faq pages and Vendors we still have.

Of course, my main site is:

http://tamw.atari-users.net

all the best

Tim Conrardy

963. Bread and Butter on TAMW

Newsgroup: comp.sys.atari.st
Date: 2002-07-17 06:31:08 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0207162231.5902bf15@posting.google.com>

More Bread and Butter on TAMW!(Tims Atari MIDI World)

I have been trying to update my sequencer section (the bread and
butter tools)on TAMW and have added MANY new
pages:

Sweet Sixteen:
http://tamw.atari-users.net/s16.htm

Edit Track/SMPTE Track:
http://tamw.atari-users.net/editrk.htm

IMS4.7 Intitive MIDI system Sequencer:
http://tamw.atari-users.net/ims.htm

Trackman by Hollis Research:
http://tamw.atari-users.net/trackman.htm

Live Plus by Harold P.
http://tamw.atari-users.net/liveplus.htm

If you go to my Index page
http://tamw.atari-users.net/timidi.htm

You will now see a number of our Bread and Butter apps in the
Sequencer
section! (Cubase, Notator, KCS)

These are great tools for the Atari platform. If you have not heard of
some of these applications, please check out these pages for
screenshots, plenty of info and of course: the downloads!

Now to get some more Butter for my Bread.:-)

965. [NEW] Falcon Demo Mania volume 2

Newsgroup: comp.sys.atari.st
Date: 2002-07-17 10:46:40 UTC
From: St&#65533;phane Perez <Stephane.Perez@imag.fr>
Message-ID: <Xns924E81FABA248StephanePerezimagfr@213.228.0.33>
Source record: 33575

Hello,

The second volume of this compilation is available now. What's new? There
are 15 Falcon demos and intros, with a special remixed version of the
Motion Demo by Aggression. All the videos are compressed with DivX codec
4.02, the sound is compressed in MP3 at 256 kbit/s.

I've not tested the video files with Aniplayer (shame on me ^_^)
DivX codecs for MacOS, Linux and Win are available on
http://www.divx.com/

* Demos *
Built in Obsolescence Digital Chaos 1994
E.X Illusion Aura 1995
Firestarter Shadows 1997
Lemon (Light version) Mind Design 2000
Mostly Harmless MJJ Prod 1994
Papa was a Bladerunner EKO 1994
Plastikk Vibration NPG 1994
Symposium 96 Contribution Hydroxid 1996
Upside Down Mystic Bytes 2000

* Intros *
Blue New Beat Development 1997
Burning Waters The Chaos Engine 1995
Cruor 96K Cruor 1995
Insanity Cobra 1997

* Bonus *
Motion (Special Edition) Aggression 1999
Oddstuff (ST demo) Sector One 2001

The CD is available on one of the scene.org FTP servers.
You can find a link on Supremacy's web site:
http://supremacy.atari.org/

Format: one 650 MB CD converted into an ISO image (RAR compression).

See you.
Strider
Salut,

Le volume 2 est enfin disponible en t&#65533;l&#65533;chargement. Au menu : 15 d&#65533;mos et
intros Falcon, dont une in&#65533;dite (Motion Demo d'Aggression). Toutes les
vid&#65533;o sont compress&#65533;es avec le codec DivX 4.02, le son est compress&#65533; en
MP3 &#65533; 256 kbit/s.

Je n'ai pas eu l'occasion de tester les vid�o avec Aniplayer (non pas sur la t�te, a�e). Les codecs DivX pour MacOS, Linux et Win sont disponibles sur http://www.divx.com/

I'm trying out Idealist now. I can print unix-style textfiles with it, and
normal Atari ones too. The LPR.APP that I was using didn't print unix
texts correctly on my HP500. Idealist does. That's what this newsgroup is
for: to help each other :-)

It will take me some more time to learn all the different things Idealist
can do, but it looks pretty good at first sight.

Hmmmm, the main difference here is that Atari are still alive and kicking. The name alone is worth alot more than you probably realise. PC's suck, Macs are OK, I suppose, Amiga is fine, but Atari is just damn nice to use. Atari will have to be prised from Infogrames before anything can be done. Then maybe it will happen. Infogrames know exactly how much it is worth, and they will not just give ANY of it away if they have any brains. I for one would love to see Atari come back again, but I think the real future is in projects like Amithlon, that is the only way we can continue. No sense crying about it, that is the future. How much money do you think Amiga one will make? F%$ all. Nice pictures too sinclap.

No, I can't let that go. As one who has, a, been there, done that from transits up to artics and b, used the postal and parcel service for the last 10 years I feel it safe to say the fault for damage is usually down to the lack of proper packing by the sender.

One layer of bubblewrap and a plastic bag (honest) is not enough packing for an ST or a monitor.

Three STs squashed in a box designed for 1 ST ain't a good idea either.

Carriage in the UK on an ST or Falcon should cost between £10 and £15 depending on the service.

If you value your Atari pack it properly!! Ten layers of bubblewrap and a solid cardboard box with no maraca effect.
(i.e. don't let it move about in the box)

Coloured parceltape on the bubblewrap helps too!

have known a well known courier company (**trak) reverse an articulated lorry over a pc, rebox it in a TV box and wonder why we refused to accept the delivery... they also put a fork-lift bald through a monitor and re-boxed it and repackaged a laptop they damaged so much the liquid crystal would pour out of the screen.... but good packaging is essential, yes.

On another topic - how much for a Falcon? =)

When I run Gluestik a message tells me that it reads my STiK configuration file (if present). If this file isn't there it uses default settings, and it still works fine. At least on my system.

Which makes me wonder: What settings exactly does Gluestik read and use from STiK's configuration file ? Anyone ?

Martin Tarenskeen

AFAIK it reads c:\stik_cfg\default.cfg. My cfg holds only these lines:
ALLOCMEM = 30000
POP_HOST = pop.pandora.be
POP_USERNAME = my username
POP_PASSWORD = my password
SMTP_HOST = smtp.pandora.be
FULLNAME = Martin Byttebier

TTYS,
Martin

I'm pretty sure it just needs this one (allocmem).

>could try it :-)

Hi!

I think that if you select 'Body copy' in 'Output options' then
IdeaList will reformat each paragraph to the set parameters for
paper/margin/fontsize/line-spacing.

If you want to keep the original layout, then I think IdeaList will
accept LF as newlines, but to be sure you can use Blinex, which comes
with the IdeaList package and is able to convert between various
line-endings, including Atari/PC CR+LF, Mac CR, Linux LF and even
NULL-byte newlines. You have the option of removing multiple spaces as
well as multiple blank lines too. It can also convert between various
character-set font tables if your text has accented characters in it,
for instance.

BTW, it's worth printing out the manuals for IdeaList and its various
programs, as they are more extensive than the HYPs.

Regards, /Peter/

Hi Steve!

No good - my son doesn't want the only spare slot used up by a
SCSI card. Otherwise I'd have gone for that solution. (I don't
need to connect more than one SCSI device to the PC, I hope.)
Since the PC has 3 USB ports, using one for the Adaptec is not a problem.

So is he saving it for something specific?. I have my SCSI DAT plugged into
mine so at least i can restore a backup, i doubt you've got any REAL mode
DOS drivers so if you went belly up your Removable media would be useless
until you get Windows up and stable again.

> Since the PC has 3 USB ports, using one for the Adaptec is not a problem.

Sure, I'm only using 2 of mine.

Message-ID: <3d3646b6$0$1424$1dc6e903@news.corecomm.net>
Source record: 33587

Hello,

I had to reformatt my Megafile 30 and SH204.
The Megafile 30 reformatts and partitions.
The SH204 reformats, but will not repartition.
I am using Advanced Hard Disk Utilities for Mega ST4.

I did a disk check with Diamond Edge.
Four partitions show up on the SH204.
I think I got the SH204 to partition
with the SH boot disk, but I don't think that is compatible with
the Megafile 30. (The SH boot disk)
When I check the disk (SH204) with Diamond Edge, I get the message:
Unrecognized boot sector.

Megafile 30 is Addressed to 0.
SH204 is Addressed to 1

I also tried Zeoring the drive.
I can't do that either. I get the message reformatt, after I just did!

What might be causing this?

Thank you.

ken

I'm sorry for trampling in your sandbox and knocking over your sandcastles,
but...

If I can't rally the troops for a cause I think is important, because no one
else does, then...

I'm gonna do my best to demoralize them to where they all give up and buy an
AmigaOne!

If I can't win by being gung-ho for Atari or BeOS (OpenBeOS), then Amiga it
is! I just want a platform that is... um... SUPPORTED and ALIVE!

Jared

Then stick to your bloody PC!! You don't own an Atari, I doubt that you even know how to use one or an Amiga. You're mental and not welcome here. Bugger off and leave us in peace.

Joshua.

I'm still surprised that anyone would fall for sinclaps line of bollox, but Jared seems to be actually *trying* to fall for it. If he things people were on his case before then he's really in for it if he starts impersonating sinplops imaginary friend

I would have thrown her after it, to give her a chance to redeem herself by
catching it!!.

I hope you dumped the bitch, or at least shagged her best mate or her
sister/mother just for revenge!!.

Is it possible to emulate an Atari STe on a PC soley with software?
If it is, where on the WWW may I find it?

It would help if any replies could be to me at

cwacole@aol.com. I don't get to monitor this Atari site very often.

I've been an ST user since 1986, but find the PC's access to the
Internet too much easier to use.

I think that Jared is one of Sinclaps alter-ego's, his Atari supporting one

Bugger
> off and leave us in peace.

I plan to keep using my PC. However, I'm hoping the Kickstart 3.1 ROMs for the A1200 arrive today, so I can get it running again.

Doubt I know how to use an Atari ST? You sad, sorry excuse for an Atarian. I'm 33 yrs. old... I was around when PONG was invented! I was there when the Atari 2600VCS was a 6-switch model! I was around when... shoot, I've seen it ALL! I've owned an Apple IIc, Atari 1040ST, Mega ST4, MegaFile 30, Atari Falcon030, etc.

Agreed, you're probably right about knowing how to use an Amiga. I owned an A500 when Commodore was still around, but hated the look of Workbench 3.1. Never got into it much. GEM looked much nicer and more polished, even as primitive as it was! And case design? Pah. The Atari 1040ST wins hands down over any Amiga! It was stylized, man! And, most importantly, I owe my love of grey ("Atari grey", as I think it came to be known as) to the 1040ST. I've loved it ever since.

But, with the advent of the AmigaOne, I've decided to take the opportunity to get back into the Amiga (thanks to my employer; the A1200 is his) and get use to the look and feel and environment of AmigaOS, so I can be totally and absolutely ready for it when the AmigaOne is available to buy!

I was (emphasize: WAS) a very die-hard Atarian, as far back as when the Falcon030 was new. But those days are long gone and they AIN'T coming back unless Atari comes back. It's that simple. And no clone or Atari Coldfire Project is gonna bring it back. Not unless you can pitch it to Infogrames and get them to start up an Atari hardware division again.

The funny thing is, we've got the people doing the hardware, but no one is interested in reviving the namesake these clones are all following in the footsteps of. I'd gladly renew my die-hard Atarian status in a heartbeat, if there was anywhere near the effort going into reviving Atari, like there

is with the whole Amiga community (and Amiga, Inc. company) behind the AmigaOne.

If the flag is down, the cause is lost. Amiga never lost it's flag nor it's flag ever knocked down, so it's cause was only deterred for the years that passed. Atari was killed and butchered for a feast to the vultures. It's flag has not only been knocked down, but it has been utterly and absolutely obliterated!

It's any wonder there's no one to rally behind it... they're all convinced their cause is lost and they simply drag on, denying the fact that they follow a dead cause. A hopeless cause. Refusing to admit they are a dead and defeated group of has-beens.

My last hurrah for Atari was shot down when they stopped supporting the Falcon030 seemingly only a few months after it was released! I sold mine and never really looked back since. The Jaguar was an utter flop! And Atari was killed off shortly thereafter... from the INSIDE!

Was it an utter conspiracy? Was Jack Tramiel always planning to destroy Atari, but knew he couldn't do it outright, legitimately, so he simply made a few neat machines and then slowly choked it to death thereafter? Did he give up on Atari, because his enemy (Commodore) was now dead, so he didn't NEED to fight back anymore?

Who can say, but I still think it's a shame history played out that way.

But now we can have a bit of the 80's again... with PowerPC processing! It's a shame it won't be a genuine Atari with the awesome fuji, but at least it will be a genunie Amiga with the Boing ball! Whee!

I'm pretty sure STe emulation has been around for awhile. Check
http://www.emulators.com/ for GEMulator and http://www.vg-network.com
for everything else.

Gee, only a non-intelligent lifeform would offer THAT as a reply.

I speak forth ages of wisdom and replying material and you come up with... a
one liner.

What are you Atarians coming to?

If y'all gonna rage against me for promoting "Atari", it's a waste of effort
for me to do so.
So... I'll promote Amiga and insult Atarians, instead! Now THAT'S
productive!

Just remember, you brought this on yourselves...

I was in your camp, TRYING to help... to bring vision and hope. You all
dissed me.
Now I stand for a banner other than Atari. At least you'll be dissing me
for a good reason, now!

See how helpful I am! You may now thank me and feel good about hating me.
:-)

1011. Amiga 1200 video weirdness!

Newsgroup: comp.sys.atari.st
Date: 2002-07-18 22:54:30 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <3d3743a0_3@corp.newsgroups.com>
Source record: 33468

Thanks to Eldor's 3.1 ROMs... the A1200 is alive again! But...

The video goes grey and the hard drive light flickers a bunch and then I get this grey screen with a vertical black bar in the middle and a tiny grey graphic something at the top of the right side and part of another grey graphic something at the top of the other side. Both look to be going past the top of the screen. There is a brief flash of green along the edges of the center black bar just as the HD is finishing it's thing.

Any idea what I'm seeing and why it's all grey? I'm using the RCA "COMP." port. (*not* the RF output) hooked up to our TV's A/V Video RCA jack.

Jared

The display glitchiness I was seeing on our TV was because the Workbench on the HD is set to a resolution our TV can't display. Upon removing the HD, the system took about 30 seconds to boot, but as soon as it saw that the disk in the drive wasn't bootable, we got the standard (beautiful?) Workbench request screen!

Is there a way to default the software on the HD to a low resolution our TV can display, kinda like a Workbench "SafeMode"?

They're working on that. At least partially, I'm not sure what limitations
the DSP code will have or whatnot.

But DSP emulation will suck no matter what. Support for a DSP PCI card
would be awesome and is probably also in the works ;)

>> interest in knowing what's going on!
>
>Club!!, tell me more?. Where is it?, when does it meet?, how much does it
>cost?, are there any fat welsh barstards there?.

Well, it's a great computer club in Cheshunt - not far from the M25 J25 in Herts. Anyone turning up will find great support for their Atari and will get to meet not only yourself Steve, but also myself and Peter West. Familiar names all.

There's no annual membership, just pay three quid at the door, and your first visit is free.

All the meeting dates and a map are available from the CCC section of my web site (the URL is in my sig!!!). Next meeting is this Wednesday next, the 24th July at the Garden Room, Wolsey Hall, Windmill Lane, Cheshunt.

Cheers

Derryck

Little Green Desktop is a good place to visit, search for them in
google.
STEEM is probably the best emulator around, IMO.

Hi,

Actually yes, if you read the mailinglist.

However, it is not intended to emulate existing hardware (this is more of a sideeffect). It features lots of cool native stuff instead with drivers for TOS/MiNT.

Regards

/Pete

Go to The Little Green Desktop. http://www.atari.st
They have a emulators section. Steem is the best right now. gemulator is
good only for applications. Games are out. Steem seems to run the most.
Also check out: http://aranym.sophics.cz/index.html still in early stages,
but looking great.

When I run the install it says it needs a raw partition. I am using ARAnyM 0.1.7 for Windows.

How do I create the partitions for this install? I'm just experimenting. :) Never used Mint before.

Ok, thanks for the advice...

Oh, and great use of astericks. Maybe even better than my post!

Jared

More one liners... how sad. I WANT MORE READING MATERIAL!!!
WHAAAAAAAAAAAAAA!

Can't you write a tome or something in reply or did you not get enough sleep
and can't muster the energy to type lots of stuff on your keyboard?

I give up... You're way beyond any sort of help. If you could even muster the tiniest bit of sanity to leave us alone, we'd greatly appreciate it. You won, we lost, Amiga won, Atari lost. Happy? Now, scoot.

Joshua.

Jared, Jared, Jared. It sounds like the Amiga thing is the same as the Atari thing. The Hades, the Milan, the Coldfire project are alive just like this new Amiga. I do not see the difference. If you just would have listened and bought either a Hades or Milan, you would have seen what I (and others) have been talking about.

>The more I think about it, the more I realize... AmigaOne means just that...
>Amiga WON!

Not really. Again, the Amiga One may be a good machine, but so are the Hades and the Milan. When the Coldfire comes out, you will see an upto-date Atari clone machine.

>Enjoy yourselves... I'm done beating this dead horse, called Atari. The

I will enjoy myself, just like I have been. And the horse is not dead. You just refused to get on and enjoy the ride. Now, you are on a different horse and I hope you enjoy yourself.

Hello,

Well if you can find one, I would get a Link 2 SCSI adapter. I have seen them
for sale at computer shows like the CGE. Try contacting B&E or else Best
Electronics. I have on hooked to my STe and it works great.

Hello,

From what I understand Gluestik will ignor certain setting in the cfg file
and only read& use the ones it uses. I do not have the RCV_WIND and
TTL settings, but I am using it with a cable modem.

Hello all,

I finally got my Hades hooked up to my Cable modem. It now works under MintNet and MagicNet using a NIC PCI card and Ozk's driver. By using GlueStik I can use Newsie, Cab, MyMail, aFTP, AtarIRC and AtariCQ. Popwatch was the only program I could not get to work under GlueStik, so I will be using PopGem instead.

My new email address will be edbaizjr@attbi.com. If you have me in your address book, please make this change. If you do not, no need to worry about it. My old one will work until the end of August. I feel that will be long enough for me to tell everyone about the switch. Take care...

Hello,

Since I will be using a cable modem, I have started to use GlueStik. However when I try to use it with Newsie, Newsie locks up my computer when I try to access the various address books or mail boxes. I have the same problem when I try to do the same thing without having the Hades's memory split into ST and TT ram. Splitting the ram solved my Newsie problem. Now, in order to get things to work I have to install STiK instead of GlueStik. Just wondering if anyone has ideas or else experiencing the same thing.

How right you are Mark. After all the talk, he just gets a 1200. He should have got an A2000 or A3000 or A4000. A 1200 is like a Mega STe or a TT and he could have gotten one of those from the beginng. from the beginning.

I think few consider any form of insults to be productive, be it in an
Atari newsgroup or an Amiga dito.

> Just remember, you brought this on yourselves...

So you plan to stick around an behave badly just because the majority
doesn't agree with you? If anything, that is sad.

> I was in your camp, TRYING to help... to bring vision and hope. You all
> dissed me.
> Now I stand for a banner other than Atari. At least you'll be dissing me
> for a good reason, now!

No reason to diss you for that, and also no reson for you to keep
posting here if the postings will not be atari related. I am certain
that the people still using their Ataris have visions too, however not
sharing yours. That is all and well, ppl need to be allowed to have
different opinions.

I think it's great you have a love of Atari computers and the will to try
and bring it back. However, the way you present it makes it the problem.
If you put as much effort into a new application or hardware design as you
do your insulting posts, we would have a AtariThree already!

As I've said before, I have vision, not technical talent. What people need to do is create this Coldfire whatever and present it to Infogrames with a business plan for the "New Atari". It's that simple.

I tell ya, though... Workbench 3.0 is still a nightmare and a horrible thing to look at compared to GEM. It makes BeOS seem... simple! Maybe it's the low resolution of our TV, but... I think I am quickly becoming disenchanted with the whole Amiga thing again. Hmmph!

Hello,

I read in your sig that you're using PlayMyCD together with Extendos
Gold. I bought this driver recently, and can't export tracks anymore
with PlayMyCD since then - the software tells me that my driver or
my unit don't allow audio extraction, though this works perfectly
under betados/Spin.
Could you please tell me if you encounter the same problem ?

Thanx in advance,

J.-Luc

HI THERE I have used HD driver and have always found it to be excellent. However on my CTB II Falcon, for various reasons, I am using the built-in driver "Cecile" Is there a way to get some of the features of HD driver while using another driver? I am thinking of the SCSIDRV features. Please forgive me if I am asking a dumb question!

>
> Won what?

Amiga was born. Commodore bought them up. Amiga became a model of computers. Commodore died. Amiga lived on through several hand-me-downs. Amiga, Inc. was created. Amiga, Inc broke away and became self-sufficient. The AmigaOne is born. AmigaOS 4 is created. Amiga is alive and well.

Atari was saved by the Tramiels. 10 years later, they kill it. "Atari" (what's left of it) is handed to JTS, Hasbro, and then Infogrames, used as nothing but a name solely for marketing game titles. The Atari we all knew is but a mere whisp of it's former self. Atari is dead and buried.

Atari is dead. Amiga is alive. In all consideration, Amiga WON (AmigaOne) the lifespan war. It is alive today, whereas Atari and it's computers are nothing but has-beens.

Why call it the AmigaOne? Why not call it the Amiga G3/600? I think a little wordplay is going on and I'm onto it... :-)

Thank you for the correction. I sensed it wasn't quite spelled right... but
I was only off by one letter. At least I didn't spell it "assturix" or
something like that... :-)

Well, just put "SCSIDRV.PRG", from S. Engel, in your auto folder.
You can find it within GEMAR and CBHD on ftp://chapelie.rma.ac.be/
or on the author's site (sorry, I don't remember the url...).

> If you put as much effort into a new application or hardware design as you
> do your insulting posts, we would have a AtariThree already!

There *are* already "AtariThree", maybe even AtariFive. I don't understand why some people are so excited by a new Amiga. There were several new Atari/TOS machines in the past: Medusa, Eagle, Hades, C-lab Falcon, Milan. A couple of others were completed, but unfortunatelly never produced (Milan 2, Phenix) and, of course, there was also some wapourware. How many new Amigas were there until now ? Only one (!), but this machine (Draco) was rather an strange semiprofessional graphical workstation than a real Amiga. If you look at Atari and Amiga OSes, you will see exactly the same situation. There are two modern TOS compatible OSes (one commercial, one opensource) + opensource TOS replacement (EmuTOS). All, or at least two, are still in development. How many alternative OSes are there for Amiga (I don't mean Linux or BSD) ? How many of them are opensource ? How often updated was the Amiga OS ? Once per 10 years ?

So I please Jared and others: Before you start to write some bulshit about new Amigas or Ataris, get yourself a Hades, Milan or Aranym, install an up to date version of FreeMint or MagiC a try some real applications. I hope it will return you back to reality.

Ctirad

Steve,

I suspected that as well for a microsecond and thought I might be paranoid,
but it did occur to me as a possibility since sinplops on occasion impersonated
both atari and amiga users over the past 10 years, including with his many
sockpuppets. I even got him in a slipup a few months ago when he said someting
about "not needing tech support for my dell" when I called him on not
participating in the mac newsgroups since he's spent the most time
impersonating a mac user.

Joshua,

The reason he keeps coming back is the amiga community won't have him,
especially after he put his kickstart roms in backwards and detonated his
A1200's motherboard.

>get?
>Paul
>

Hi Paul,
Firstly, proceed at your own risk :) For a temporary fix, (with the
unit off) pop off the cap of the key with the problem. Don't try that on
the larger keys (some are wired and it might break the plastic). Press the
plunger down and put in a drop or two of alcohol. Depress and release the
plunger several times. Let the alcohol dry and snap the key cap back on.
Works for my MegaST4.

Um, hello? Are *YOU* A+ Certified as a computer repair technician? I am... so let's not go there, shall we?

At the very worst, I *might* have removed and accidentally reinserted the Kickstart 3.0 ROMs starting at the front of the socket, instead of the back. But that's only because I thought the ROM was the same size as the socket. When, in actuality, the ROMs are 40 pin and the sockets are 42. I never inserted them backwards... just *possibly* at the wrong end of the socket (assuming they weren't already in the wrong end, which I tend to think they were, because I lifted the first ROM up and then reinserted it in the exact same position the other one was and simply duplicated that procedure on the second ROM).

However, I was planning on upgrading to Kickstart 3.1 ROMs anyways (which I've just done correctly, I might add!). So, the only loss is the fact that I can't sell the 3.0's, since they're, in all likelihood, as dead as the Atari scene. :-D

No, I didn't blow up the A1200 motherboard. It's working as fit as a fiddle. Now, if I can just get a mouse and a monitor for this puppy, I'll be ready to go!

Jared

I don't think that this is possible with Cecile, because Cecile does not
support the SCSI Driver protocol. Both drivers would compete for the IDE
and SCSI bus, which will most likely cause problems. Two drivers that
support the SCSI Driver, on the other hand, would not have problems to
coexist.

Could you tell me more about those "various reasons" ?
I have never managed to get that Cecile driver working on my CT2b-Falcon.
I'm using HDDRIVER, but not all versions I tried work.

Crappy Amiga? Now, correct me if I'm wrong, but... WHICH company is STILL alive and MAKING Amiga hardware? Oh, yeah... Atari, right? Oops, I'm sorry... that should be AH-MEE-GAH! Which company is now producing NON-LEGACY hardware with a PowerPC-native OS? Oh, yeah... AH-MEE-GAH! Which company HAS a future? AH-MEE-GAH!

Off-topic, I be... yes. Crappy Amiga? No. Companies that make crappy computers don't last. Um... so far as I can tell, where is Atari now? So, guess who's covered in steer manure these days?

> BUGGER OFF!

Don't worry, I will... but people keep replying and giving me reason to reply back. If y'all would just IGNORE me, I'd have little to no reason to stick around and you could go back to whatever 101% meaningful Atarian thing it was you were doing before I came in.

I'd rather be an Atarian, but I only go where I am supported and where there is new hardware and software. Atari is dead. Atari clones are nothing but extentions of the legacy Atari started years ago. Amiga is alive. Kinda takes away the question of "Which platform do I follow?".

Jared

1071. Atari - Jack Tramiel 10 Commandments

Newsgroup: comp.sys.atari.st
Date: 2002-07-20 16:47:04 UTC
From: computerclassics@netscape.net
Message-ID: <2295b3fc.0207200847.383b8bcf@posting.google.com>
Source record: 33381

During Jack Tramiel's early days at Atari he brought out the ST line and surrounded it with a lot of fanfare and marketing hype. Among the most remembered hype was "The Atari Ten Commandments":

* 01. We shall create a computer that will be a landmark in the history of computers.
* 02. We shall create a computer that is as smart as the buy who buy it.
* 03. We shall create a computer that sets a new standard for speed and performance.
* 04. We shall create a computer that lets consumers choose what is right for them.
* 05. We shall create a computer that gives consumers power without the price.
* 06. We shall create a computer that is as powerful in the music studio as it is in the office.
* 07.
* 08.
* 09.
* 10.

Does anyone know if Tramiel ever finished the 10 Commandments? If so, can you tell me what 7-10 were? Thanks!

Bill G

1072. Help with Sound system

Newsgroup: comp.sys.atari.st
Date: 2002-07-20 16:53:41 UTC
From: peter.slegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <1027180421.1028.0@iris.uk.clara.net>
Source record: 33378

Hi all,

More or less ever since I have had this Milan I have had a
problem with the sound system.

It works perfectly most of the time and then suddenly with no
error message and with no obvious cause it stops working and there
is no more sound output.

For example. If I play sound files via Aniplayer it suddenly stops
making sound but otherwise it continues playing files as though
everything is working. The only hint of a problem comes from the
percentage indicator in the Aniplayer window which starts displaying
values like 15%, 109%, 14%, 127%, etc.

It's not just Aniplayer that is affected though, once the sound
system is broken, GEMJing is silent too. I have found that I can
usually cause the problem to appear by moving the slider in the
Aniplayer window but it also appears when using GEMJing.

The only thing that fixes the problem is a reboot which obviously
re-initialises something.

I feel that the problem is in the software between the application
and the hardware. I tried upgrading to a later version of the
MilanBlaster software but that made no difference.

I increased the amount of ST-Ram to 14Mb as I read that using less
could cause problems with the Soundblaster driver.

I am using Mint and NAES 1.2, do either of these have any affect
on the sound system?

This may be unrelated but I see on acp.atari.org that there is a new
pci-bios for the Hades is there any benefit in using this on the Milan?

All ideas gratefully received.

Regards,

Peter

PS
I have been having a lot of problems with NGs via my isp
so I am trying my back-up isp. I hope this works.

Try this to avoid a reboot: open the Soundblaster Mixer and clic on Reset.

This is after all a newsgroup for Atari computers (including all its
offspring, which to the best of my knowledge doesn't include the Amiga
range of computers)
You may of course use the computer you see fit, but wouldn't it be
more appropriate to perform Amiga talk in the Amiga forum?

Message-ID: <3d39b444$1_2@corp.newsgroups.com>
Source record: 33385

Commandment #4 was, technically, a lie (all built-in hardware, no slots or upgradable options, until the STe/TT/Falcon030). However #5 was the motto we all lived by and loved so well. If Commandments #7-10 were never given, it's proably because Atari was on it's way out by then.... losing the battle to the Commodore Amiga, which was upgradable, even from the A1000, IIRC.

I remember reading the 10 Commandments in Compute!'s Atari ST magazine... ah, my favorite! Atari Explorer was my other favorite. STart was good too. Anyone remember the tech magazine "ST Applications" (my friend, James, once saw the magazine and thought it said "STaple Cushions" (laugh))? Ah, the good ol' days...

Not here to troll, just to offer my view as a previous Atarian.

Jared

Why don't you ran an emulator, crash it and hit PrintScreen?

Cheers
Themis

they wont take him for being too cruel and unusual. I suggest we nominate him for iKOTM instead.

Because I'm at school and there are no busses home in about three hours, I don't want to get and install an emulator here, I would have to figure out some good way to crash the Atari (not the emulator as you suggested), and I figured someone already did pretty much exactly that and has a nice little gif somewhere.

Whoa! Finally some interesting details concerning the ACP!

Of course, AmigaOS 4 is still in the works... maybe released this year, maybe not. Kinda took a lot of the wind out of my sails when I got that answer from Hyperion Ent. today.

I'll be keeping a close eye on both ACP and AmigaOne's progress. Wonder which one will finish the race first? Hmm.

Not trolling, just strolling...

Jared

> and MiNT supporters.
> Which road is the Coldfire Atari going to follow ?
>
> OK :
> We will choose for the only usefull and possible way :
> using TOS and MiNT we
> will have a modern OS, which will be able to load
> MagiC on demand.
>
> TR :
> What are the pro's and cons for MiNT, MagiC ?
>
> OK :
> Besides the problematic installation of MiNT, MagiC
> has no more advantages
> for me. If you consider the fact that we will pre-
> install the OS in the CA
> in Flash ROM, and that the user will not have anything
> to do with it's
> installation, the argument : difficult installation of
> MiNT, loses it's
> meaning.
> MiNT gives us innumerable advantages in comparison to
> the commercial, closed
> MagiC system. Right now, thanks to MiNT, we can use a
> great amount of
> software from the Linux world, also a port of an
> actual browser would give
> much problems with the new hardware. The most
> important point and advantage
> remains the possibility of future development of the
> OS, with MagiC this
> remains unsecure.
>
> TR :
> What about TOS ? Which version will be used ?
>
> OK :

> In cooperation with Milan Computersystems we will be
> able to use the actual
> Milan TOS, (that means the new developped Milan TOS
> for the Milan II) as the
> OS for the CA. (Milan has the rights to develop
> TOS)This means a great
> profit for our project because we can use a well
> documented and a debugged,
> clean version.
>
> TR :
> Interesting for longtime Atari users is the
> compatibility of the new
> computer to old programms. This is always a critical
> issue, because new
> systems have to cut old ways. How will you maintain
> compatibility to older
> programms ?
>
> OK :
> I think the old days are over. If you still want to
> run ST prg's from 89 you
> should keep your ST, Falcon, MegaSTE and TT on your
> desk next to the new CA.
> Between the old Atari's many prg's are incompatible
> too. Striving for
> maximal compatibility should not hinder development.
> Who needs the antique
> low grafic modes of the ST nowadays ?
> At the developpers meeting we agreed : whith the new
> Coldfire computer we
> will have no probs to port an actual Atari Emulator
> natively. Then most of
> the oldest unclean ST games will run on the new
> computer. Result : finally
> we will end up with the most compatiblke Atari
> computer ever !
>
> TR :
> A deception for the Atari users was the price of the
> new computer : 1000
> euro (=1000 $$ now !!) only for the motherboard.

Everyone,
This is a translated article from STC over in
germany. From a friend of mine in Holland. he has
been asked by MyAtari to translate any new articles by
STC and MyAtari to get more information out to the
English speaking Atari users. We as Atari users
really need to band together and avoid this guy Jared.
The only way Atari computers will ever survive is
through Atari clones. So support the XTOS movement as
well as ATSF!!!!

Thanks,

>>Hello Carey,
>>Here the definate translation of the report on the
xtos meeting in
Dresden, which,
>as
>>a full blood Atarian will make your heart beat go
faster too, no doubt
>about
>>it.
I'll send the xtos interview too in a week or so.
I have sent a copy to Lance too.

Cheers
Dan

>>
>>COLDFIRE TALK
>>
>>In the last issue of STC we mentioned the first
official xtos meeting of
>>renowned persons in the Atari scene in Dresden. Hard-

and software
>>developpers as well as planners joined at the round
table to give Atari a
>>new future. The results, goals and plans concerning
the new Coldfire Atari
>>are revealed in the following interview between
Thomas Raukamp and Oliver

>>Kootschi, the new leader of the project :
>>
>>TR :
>>Oliver, the first xtos meeting is a fact now. Now, a
few weeks later,how
>are
>>your feelings concerning the Coldfire project ?
>>
>>OK :
>>Our meeting in Dresden was for me and the oither
participants a great
>>experience. It is very impressive when 20 Atari
enthusiasts from different
>>parts of Germany and other countries meet e.o. to
participate in the
future
>>of the Atari system and decide to work together. But
the most important
for
>>me was that we managed to create amongst the
developpers the spirit to
make
>>possible a big project like this one without the
help of a big supporting
>>company.
>>
>>TR :
>>Up till now you were not the coordinator of this
project. How come that
you
>>are now the leader ?
>>
>>OK :
>>
>>Since autumn 2001 I have been in close contact with
Ulrich Goessel and
>Fredi
>>Ascwanden concerning the Coldfire project. When we
met the first time at
>the
>>Atari Expo in Koln it was clear that I would
participate in the
>developpment
>>of the CFcomputer You can imagine that bit by bit I
became the
coordinator,
>>not in the last place because I was so busy with the
Deesse card and have
>>many contacts with many Atari developpers.
>>What also played a role was my warm relationship

with Milan and the Falke
>>Verlag (STC), to you and Ali Goukasian, without
these contacts a
>>cooperation with xtos would not have been so
natural. For the CF project
>>this means a great advantage. We (xtos) and Milan
cannot afford anymore
>>hostilities, we should work together to realize this
project.
>>
>>TR :
>>In which way is you company "Frontier Systems"
involved in the xtos
project
>>?
>>
>>OK :
>>Frontier was started to make a sort of platform
where all interested
>>developpers could be united in the developpment of
the Deesse card. Then
>>Frontier acquired the rights to sell the Eclipse in
Germany. Later we
>became
>>acquainted with the CF project because of the plans
to integrate the
Deesse
>>in the Coldfire. Now this project has absolute
priority for us and in the
>>future it it very obvious that we might become the
platform for the
>>distribution in Germany for the CF Atari.
>>
>>TR :
>>In which stage is the CF project at present ?
>>
>>OK :
>> Now we are in the final stage of planning of the
hardware. We have to
test
>>in detail if all the planned features are feasable.
This is the most
>>important phase because we have decide in detail
about every piece of
>hardware we intend to use, any change in plans in a
later phase would mean
a
>lot of extra work which we want to prevent at any
costs. In this actual
>planning phase we can still make decisions on

changing this or that chip,
>feature etc.
>
>TR :
>Up till now this project was an idea of Medusa
Systems, who has in the
past
>realized the Hades and Medusa clones. Now the project
is a joint project.
>How and why did you decide to work together ?
>
>OK :
>In my opinion this sharing of tasks is absolutely
necessary because a small
>company like Medusa Systems could never cope with
such a big project. It
not
>only involves hardware, but also software. In the
past hardware developpers
>made great hardware, but then on the software side it
showed up there was
>not enough developpment for the macine. It was always
"hardware top -
>software flop". It was immediately clear to Fredi and
I that we could only
>realize this huge undertaking by means of a joint
task force of different
>companies. We then decided that I would care for the
coordination of all
non
>hardware aspects of the project. Fredi knows from his
own experience the
>great amount of work it takes to make an Atari
compatible computer and this
>joint effort is the best chance to ensure future
succes for Atari based
>systems.
>This is a unique joint effort made by people on a
voluntary, non profit
base
>without an anonymous company making sharp
calculations to ensure maximum
>profit.
>After Fredi and I came to these conclusions, as a
next step we have
>contacted Atari hard- and software developpers and
have organised this
>meeting in Dresden.
>
>TR :

>Who has decided on the assignment of the different
tasks ?
>
>OK :
>This assignment, which you can read on our website is
the result of the
>developper meeting in Dresden, it came spontaneously
and on a voluntary
>base. In the first place it depends on the individual
talents of the people
>working on the project. It is not fixed though, it
can change any moment.
>The project is open, any new, interested developper
can join in the team
at
>any moment, we welcome everyone who wants to help,
there is much to do,
>consider for exemple the developpment of new drivers
for PCI cards !
>
>TR :
>In which way is Medusa Systems involved ?
>
>OK :
>Medusa, Fredi's company, is responsible for the
developpment and
>construction of the hardware, incl my Deesse (DSP)
card. All the others
work
>mainly on the adaption and development of the OS and
on new software for
the
>Coldfire Atari.
>
>TR :
>How does the Atari world react to the plans ?
>
>OK :
>The Atari world is divided in several groups which
make it difficult to
give
>a judgement about that. Anyhow I see a very positive
attitude, especially
>from the developpers side. You can clearly sense that
there is a certain
>nervous tension in the air, everyone would like to
have the new computer on
>his desk right now.
>The normal Atari user is more sceptical which is not
surprising due to the

>failed project of the last 5 years As long as we have
no real and working
>computer, there will always be doubts but you can
sense a positive
>attitude.here too.
>From musicians I got many questions about the Midi
and sound possibilities
>of the new computer. Users want an up to date machine
regarding these
>features. I can imagine this all too well, I use my
Falcon for years
already
>for music and I am constantely confronted with the
restrictions of this-
>compared to actual standards- old computer when I
manipulate souns files
>with Cubase Audio. To this group we give a clear
signal : the new Coldfire
>computer will have midi I/O and a very powerfull DSP.
We will create for
>musicians a machine with great possibilities !
>
>TR :
>Some confusion arised about the name "Atlantos". IMO
this is not the right
>name because according to the legend this city
disappeared with man and
>mouse into the sea. We haven't heard this name
mentionned anymore since
some
>time.
>
>OK :
>You are absolutely right, the launch of this name 2
days before the Dresden
>meeting was not a wise thing. A definitive name will
be given after a
voting
>between the developperes involved. In the mean time
we will speak of the
>Atari Coldfire Project. At the meeting we have
discussed about the name of
>the new computer but decided to postpone this issue.
>
>TR: I get the impression that the project is going
into 2 separate
>directions : there are two different websites with
different news : the
>xtos.de site and the Atari Coldfire site...
>

>OK :
>This is due to the fact that the developpment of the
Atari Coldfire
Project
>(ACP) and the cooperation with Atari developpers has
grown enormously over
>the past few months and and now has grown into a
common project. This is
why
>we had to create a new common website. The webpages
of xtos are now
>excusivly devoted to the new Atari Software
Foundation created by Ulrich
>Gossel , the Coldfire Project site is devoted to our
common ACP.
>
>TR :
>Let's talk technics now.
>When it was anounced that the Coldfire would be the
new CPU for the new
>Atari system, there were several doubts and
contradictions. Rodolphe Czuba
>for exemple claimed that the Coldfire would not be
fit for an Atari clone
>because of compatibility problems. Meanwhile you
stayed with the Coldfire
as
>CPU. Are there new insights regarding to the
compatibility ?
>
>OK:
>Compatibility was an issue during the conference of
course. But it became
>clear very quickly during the discussion that for a
real Atari successor we
>have no other choice than to opt for the modertn
Coldfire series. With the
>release of the Coldfire V4e there will be no more
major compatibility
>problems with the 68K generation anymore. It is clear
though, that the
>Coldfire isn't 100% compatible to the 68k series but
should that be a point
>not to proceed ? If we kept on trying to be always
compatible to older
>standards there would never be a movement towards
new hardware, it would
>restrict us. This also counts for software. It can't
be denied that
Motorola

>claims the Coldfire to be the official 68k successor
and sells it as such.
>In the Coldfire Routmap future generations of
Coldfire cores are planned
>which ensures that this CPU has a future .
>The most important is that we all agree about the use
of the Coldfire, For
>us it is the only logic and possible way the Atari
hardware should go.
>
>TR :
>What about the availability of the Coldfire V4e
>
>OK :
>According to Motorola the Coldfire V4e should be
available in the course of
>this year. A meeting of Fredi Aschwanden with
Motorola is planned this
month
>and we hope to get futher info from them about the
dates.
>
>TR
Will it be possible to swap the processor, for the V4e
? (Because the
Coldfire V4e is not yet available, Fredi Aschwanden is
using the Coldfire
5407 and replace it by the V4e later)
?

OK :
Yes, just like on the bplan PPC board, it will be
possible on the xtos board
to replace the processor by the stronger V4e. We
designed a special socket
to make this possible via plug and play, without
soldering. With regard to
the Coldfire V4e and it's future generations (see road
map Coldfire on
Motorola site) this has enormous advantages, you will
only have to swap one
processor for a newer, faster model, without having to
buy a new board as is
the habit with all known computers nowadays. Another
advantage is that,
without much development, we can react rapidly to new
features which
Motorola will integrate in the Coldfires like
ethernet, USB etc and be able
to use this in a simple way. When we would integrate

the processor on the
mainboard, this would be impossible.

TR :
It is quite a while since Motorola announced the V4e,
are the specs still
the same ?

OK :
Yes, a speed between 225 Mhz and 333 Mhz depending on
the manner of
production (20 or 13 micron)

TR :
Another remarkable feature of the Coldfire Atari is
the lack of AGP port for
fast graphic card. What is the reason for this ?

OK :
A perfect integration of graphics in the CA is one of
our greatest concerns.
Over the past weeks we have invested much time in
figuring out the best
solutions and we are in close contact with several
graphic chip producers. I
cannot yet give you the definite solution yet. On one
hand we need a fast
and modern graphic chip, on the other hand it has to
be available for a long
period. And : the best chip is of no use for us if we
don't get optimal
development support of the chip producers. It is this
support that nowadays
creates big problems for projects like ours because
the producers are not
very keen on giving documentation about their products
and are even more
reluctant to pass on to others the 3D functions of the
chips.
Nevertheless we have archieved great results, thanks
Norman Feske, Markus
Fichtenbauer and Leon O'Reilly, who have relentlesly
tried to persuade the
graphic chip producers to cooperate.
If we have to choose for AGP or the PCI variant,
depends on our continuing
negotiations with these producers.

TR :
Is the Radeon chip from ATI being considered ?

OK :
Indeed the integration of graphics via AGP slot seems
the best solution to
us at the moment. Nevertheless the PCI variant is
another option if our
first tests with AGP are unsuccesfull. The choice of
graphicchip and the
quality of it's drivers is much more important for
optimal performance than
the choice between AGP or PCI : and as I mentionned
before, we have had
frequent contact with the producers, to be able to
make the best choice. We
have the choice between chips from nvidia, ATI and
Matrox. Because all of
them have nearly equal 2D performance, we will choose
the one that allows
for the best integration in the Coldfire System and
has the best
documentation available. At the moment it seems that
the G450 from Matrox
has the best chances.

TR :
How about the 3D support of the chip ? Projects for
porting the Open GL
standard haven't been completed unfortunately...

OK :
Standard 3D support would indeed be a novum on the
Atari platform and it
would boost considerably the objective and subjective
system performance,
particularly for the all important multi media
programms nowadays. We are
very pleased that for this important area we managed
to get support from
Leon O'Reilly, who will make the complete 3D graphic
chip driver development
for the CA. Leon has gained much experience in 3D
programming of modern
graphic chips in his job as a developper in the
software company Bullfrog.
He also worked on the 3D graphic-engine of Quake3 and
in Playstation2 games
like the Formel-1-simulator F1.

TR :
You mentioned that the integration of AGP is a
problem. Is there not a
danger that soon there will be no more graphic cards
available for the CA if

you have to drop AGP ?

OK :
We are aware of this and that is why we lay a great
importance on the
carefull choice of the sort of integration of graphics
and the graphic chip.
The final solution is not made yet because we are
still in the process of
evaluating the different possibilities.

TR :
Which advantages does the integration of the graphic
chip on the motherboard
have in your view ?

OK :
The onboard solution, which we have also discussed
during the meeting,
surely has some advantages : it is compact and
programmer-friendly.
Disadvantages are the considerable extra amount of
work on the hardware
developpment side and the extra time and costs arising
from that, because no
chip designer will give documentation for such an
integration : this means
we would have to make all the graphic hardware
ourselves. This couldn't be
realized for the first CA and wouldn't be of any
benefit. The choice for an
external grapics integration doesn't mean that we have
to renounce a variant
with an onboard solution in the future...

TR :
Concerning SOUND, the Coldfire Atari is going to set
new standards, Falcon
owners can once again rejoice in a real succesor. Will
the the integration
of the Deesse DSP card be onboard or as a PCI card ?
What would the
advantages and disadvantages be for both cases ?

OK :
We have chosen to integrate the Deesse as a PCI card.
The only advantage of
an onboard solution would be that we could guarantee
the programmers that
they would find a DSP in the system, just like in the
Falcon (??). This
advantage looses it's meaning quickly because we will

integrate the Deesse
in the system as well as from the hardware side as the
software side. Every
Coldfire computer will have, standard, a Deesse DSP
card. From the software
point of view it is our definite goal to integrate the
DSP as a standard,
fixed hardware component in the Operating System,
sothat the programmers can
rely, just as is the case with the Falcon, on a DSP.
Besides that the PCI variant gives us much greater
advantages : the user
will have the possibility to add a faster card with
multiple DPS's if he
needs them, without having to buy a new CA successor.
Because of this we
have designed the drivers to cope with more DSP's even
though the standard
CA will have one DSP. In this way programms will be
able to take advantage
immediately from the extra DSP's !

TR :
How about the development of the Deesse card ?
Unfortunately Hades and Milan
owners can't buy the card yet...

OK :
With respect to the Coldfire project the Deesse
development got a new
meaning for us. For our team it is very important that
we coordinate the
development of both projects. The continuing Deesse
development has now the
goal to support the Coldfire Atari and to make
exploite fully the DSP in
combination with the CF CPU via adapted programms.
Mariusz Buras has worked
hard on the Deesse PCI integration over the past
months and we were able to
test a finished version during our meeting in Dresden.
We could also solve
our last lay-out problems with the help of Fredi
Aschwanden and Elmar
Hilgart could now order extra Deesse cards from our
chipcard manufacturer.

TR :

There was some discussion on the developpers meeting
about the integration

of a diskdrive. You know my point of view : we should
abandon this fosile
and turn to cdrom and cdwriter, just as Apple does.
What was the reason for
the integration of a diskdrive in the Coldfire
computer ?

OK :
I agree, a diskdrive is a fossile nowadays. The only
reason for integration
would be if a necessary chip on the mainboard would
have the possibility for
support anyhow. (if that chip, besides other important
functions would also
have a diskdrive supporting possibility, why not
integrate it ?). Anyhow, we
agreed that we will not offer at all costs such a
device. It will be left to
the user to decide if he wants to install one. The
role of the ancient
diskdrive will be taken over by the cdrw in the new
computer.

TR :
Things like LS 120 and ED will not be considered ?

OK :
They have never been considered. These are formats
that would bring no
advantages.

TR :
Concerning USB 1.0 and 2.0. You want to integrate both
standards. Isn't USB
2.0 enough, or isn't this standard backward compatible
?

OK :
USB 2.0 is backwards compatible so it's integration
would support a complete
set of USB peripherals.

TR :
Does the Coldfire support both standards ?

OK :
No, the Coldfire V4e supports only USB 1.0. This is
designed for slow
peripherals like mouse, keyboard, printer etc. We
should realize that USB
1.0 is integrated in the V4e, the support is on the
chip itself, a sort of

extra without costs for us. A USB 2.0 support could be realized through an
extra USB chip on the motherboard, but we decided to do it via an external
PCI card.

TR :
Talking about USB we come to the driver programming. Of what use is USB
integration if there are no drivers for USB peripherals ?b How could the
problem be solved ?

OK :
You are right. The experience with clones like the Hades and Milan has shown
a lack of support for modern standards. There was a lack of PCI driver
development. There were nearly no drivers and if there was one then it was
commercial and often not matured. To prevent going through the same
experience with the new Coldfire Atari, we have already invested a lot of
work into the future driver development. But the most important part has
begun on the developpers meeting in Dresden : the start of the development
in a joint project, without the support of a team of developpers this
project cannot be realized.

TR :
Why do you connect the mouse and keyboard via the PS/2 standard ? Wouldn't a
connection via USB make more sense ?

OK :
USB is a new field for Atari development We cannot expect a perfect USB
support immediately so it's logic to rely on the unproblematic integration
via PS/2 in the system

TR :
The question arises here on which level the USB drivers will be integrated.
If you want to configure at low level, then USB drivers should be present in
the kernel. This is also true for connecting mouse and keyboard.

OK :
On the long term the goal is to integrate the USB drivers in the system. It should be clear that we cannot catch up with the new modern standards immediately, the development in the Atari world has come to a stand still over the last few years. We are doing our utmost to catch up, and this gets a new impulse with the arrival of a new promising Atari system like the Coldfire Atari.

TR :
You are not integrating FireWire in the system ?

OK :
USB 2.0 is a perfect substitute for FireWire. Development and integration of both would mean a waste of ressources which we cannot afford in this stage of development. We are not opposed to a support of FireWire via a PCI card solution. A PCI integration would be a better choice anyway because FireWire peripherals are not so common and much more expensive than USB gear. It should be clear that every extra integration during the initial development phase of the CA will drive up the price and postpone the date of release.

TR :
Traditionally, the Atari world is divided into MagiC and MiNT supporters.
Which road is the Coldfire Atari going to follow ?

OK :
We will choose for the only usefull and possible way : using TOS and MiNT we will have a modern OS, which will be able to load MagiC on demand.

TR :
What are the pro's and cons for MiNT, MagiC ?

OK :
Besides the problematic installation of MiNT, MagiC has no more advantages for me. If you consider the fact that we will pre-install the OS in the CA in Flash ROM, and that the user will not have anything to do with it's

installation, the argument : difficult installation of
MiNT, loses it's
meaning.
MiNT gives us innumerable advantages in comparison to
the commercial, closed
MagiC system. Right now, thanks to MiNT, we can use a
great amount of
software from the Linux world, also a port of an
actual browser would give
much problems with the new hardware. The most
important point and advantage
remains the possibility of future development of the
OS, with MagiC this
remains unsecure.

TR :
What about TOS ? Which version will be used ?

OK :
In cooperation with Milan Computersystems we will be
able to use the actual
Milan TOS, (that means the new developped Milan TOS
for the Milan II) as the
OS for the CA. (Milan has the rights to develop
TOS)This means a great
profit for our project because we can use a well
documented and a debugged,
clean version.

TR :
Interesting for longtime Atari users is the
compatibility of the new
computer to old programms. This is always a critical
issue, because new
systems have to cut old ways. How will you maintain
compatibility to older
programms ?

OK :
I think the old days are over. If you still want to
run ST prg's from 89 you
should keep your ST, Falcon, MegaSTE and TT on your
desk next to the new CA.
Between the old Atari's many prg's are incompatible
too. Striving for
maximal compatibility should not hinder development.
Who needs the antique
low grafic modes of the ST nowadays ?
At the developpers meeting we agreed : whith the new
Coldfire computer we
will have no probs to port an actual Atari Emulator

natively. Then most of
the oldest unclean ST games will run on the new
computer. Result : finally
we will end up with the most compatiblke Atari
computer ever !

TR :
A deception for the Atari users was the price of the
new computer : 1000
euro (=1000 $$ now !!) only for the motherboard.
Several people pointed out
that the price for the new Amiga One G3 would only be
600 euro. What is your
reaction to this ?

OK :
Of course, we could also have promised a price of 600
euro. But why should
we be unrealistic about the price ? In that case the
Coldfire project would
have died immediately after the release, because we
would be bankrupt. To
understand the price of 1000 euro, you should know the
problematic situation
of our platform in todays world. The market is too
small for mass production
of a CA. Our first goal is to provide a new system the
still active existing
Atari users. and to bring the system to the actual
standards. Only then we
can start to open new markets for the CA and to awake
interest among new
potential users.
It should be clear that everyone involved in this
project works on a purely
idealistic basis, nobody earns a cent and the sales
will only cover the
expenses made. It is unrealtic to believe we could
simply and rapidly make
the PC world happy with our system and become rich.
Before we can even start
thinking about this we should do our homework and
bring our system to actual
standards.

TR :
Do you intend to sell only motherboards so that users
and sellers can build
their own systems or do you also intend to sell a
complete system including
drives, mice, keyboards etc...?

OK :
A complete system at this stage of developpment is not
our main goal, but we
are sure that we will also offer a complete system.
This is due to the many
suggestions and ideas from the Atari users on the
newsgroups and forums on
the internet, who have contributed to this theme with
many constructive and
remarkable ideas. I am also convinced of providing a
complete system with
certain unique Atari looks, contrasting to the mass
products of the PC
world. But before this can be realized, a lot of work
has to be done.

TR :
How much RAM will the standard system have ? And which
kind of RAM ?

OK :
At least 256 Mb SD-RAM. We will adapt our final RAM
amount to the actual
standards, so that we obtain the
bestprice/performance.

TR :
The hardware specs are almost fixed, the developpers
have been found. When
can we expect the new computer ?

OK :
All of us would like to have it right now on our
desks. But this can't be
done overnight, everybody can understand that. We work
on this project with
all our energy so that we can release the computer as
soon as possible, and
I personally hope to release the CA before X-Mas this
year. This is my
personal view, we should not forget that we work in a
team and depend on
e.o., it is impossible to give a fixed date yet, that
would be unfair to the
rest of the team.

TR :
Oliver, thank for this interesting interview.

Carey Christenson

1083. ATSF interview!!!

Newsgroup: comp.sys.atari.st
Date: 2002-07-21 04:21:46 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1027200148-745264AEicMi@williams-net.com>
Source record: 33392

Everyone,
Here is the last article for now. I will post other articles that my friend translates for me to get the word out on the XTOS and ATSF movement!!! Still working on the newsgroup FAQ, which will include several web-site addresses for the new people who visit our little piece of the web!!!!

Thanks,

From: "A.A.de Hulster" <aahuls@xs4all.nl>
To: "Carey" <firest@williams-net.com>
Date: Fri, 12 Jul 2002 22:56:16 +0200

Hello Carey,
How are you ?
Here is the promised translation of the interview between the chief editor of STC and Ulrich Goessel (the founder of the xTOS and ATFS (Atari/TOS Software Foundation) The site of the ATFS is now :
http://www.xtos.de
The ACP (Atari Coldfire Project)site is :
http://acp.atari.org/

They took me quite some time to translate pfffff.....
I sent the ACP and ATFS interviews to french and English online mags too with the demand to bring more news about those important developments to french and english Atarians and to keep them up to date in the future. They agreed and a french mag has already made a resume in French of the interview.
They should be a bit more promotion activities to make the succes maximal ! Could you also send a copy to Lance and or other Atarians in the States you know ?

You will hear from me soon.
Cheers
Dan

ATFS talk .

The Atari/TOS software Foundation intends to secure the continuity of Atari software. The idea could be unique in todays computerworld : users get the possibility to support their platform directly. Thomas Raukamp interviewed the ATFS and xTOS founder Ulrich

Goessel about the goals of the organisation.
The interview was published in STC 06-02 The road to new software ?

TR:
Ulrich, since a long time there are complaints about the lack of new software for the Atari platform. In spite of that nothing much happens. Now with this ATFS (Atari/TOS Software Foundation) you propose a new concept for the maintainance and
futher development of Atari software. Please tell us in your own words exactly what the ATFS is...

UG:
The ATFS is a software initiative, founded on the engagement of Atari fans and it's goal is to revive the software market. It is financed by the members and it collects money which is used for new software projects. In other words, together we put money in a big jar and out comes software. Because the ATFS is commercialy orientated, it goes one step futher : the new ATFS software isn't for the sole benefit of ATFS members, but can be purchased by everyone and even be distributed as freeware in some cases. The profits made from the sale of the software flow into the big ATFS jar again and will be used for other projects again.

TR:
What moved you to start the ATFS ?

UG:
Three reasons for that :
First of all : the lack of modern and powerfull software in important fields like the absence of a webbrowser which is up to modern standards, an up to date midi sequencer, a modern powerfull allround graphic programm and of technical software, business software etc. I could add many other things to this list.
In the second place the ATFS was started because of the abundance of existing and available but not maintained software (without updates because the authors have stopped the futher development), software which would be worth to be revived, but which is leading a sleeping existance in some desk of the author. This is for us insupportable. In many cases it wouldn't make sense to invent the wheel again and to write a programm from the start if there is already a similar, existing programm since a long time. There is a huge amount of old software that would render great

service after a modernisation.
The third reason is that in the actual TOS market it is impossible to stimulate a software development that aims at the demand of the users, for exemple actually there might be 3 programmers working on 3 different Atari newsreaders at the same time for which there is no demand whilst on the other hand Atari software users are in great need for a modern webrowser ! The ATFS want to change this absurd situation that software is being made for which there is no demand and that the users depend on the hope that some developpers might choose a certain software theme. The ATFS wants to give a certain guidance to the software development based on the needs of users and shaped to their wishes.

TR :
Is the ATFS a Foundation in the legal sense of the word ?

UG:
No, from the juridic point of view a foundation is difficult to realize and it requires a capital from the start that will be used for a certain purpose. The ATFS doesn't have a start capital, but collects this in a period of time and will then use it for a certain purpose. It is in that way a quasi Foundition, or to say it in a better way : a commercial software initiative with the character of a foundation. Juridic the ATFS is a special sort of company form which requires little start capital and little effort and which is at the same time very flexible and allows freedom to act.

TR:
Who can become member of the ATFS ?

UG:
Everyone who wants to support the Atari/TOS market, everyone who wishes that our market gets new and powerfull software, everyone who wants certain existing software to be revived and other new software to be created. In one word everyone who want to contribute personally to keep alive the TOS systems.

TR:
Are once-only money contributions welcome or should there be regular contributions ?

UG:
Yes and yes. When you become ATFS member, you will get a one year membership. The contributions for that year

can be payed per month, per 4 months or per year depending on the wishes of the member. Because the actual members prefer different terms, regularity is secured already. Of course we would also welcome once-only contributions as long as they are conform the actual membership contributions or beyond. You could for exemple pay a once only sum for the duration of 3 years. We can offer custom made solutions for individual wishes.

TR:
What does a user get for his invested money ? Which advantages does he get ?

UG:
He can expect within a certain period of time (new) software that actually doesn't exist anymore or is hardly available on the Atari/TOS market. An ATFS member has the advantage of discount on the price of ATFS software over the non-member. The discount percentage depends on the type of membership you choose and is valid over the entire period of membership and has no restrictions on the number of programms you buy. Because we also intend to put smaller tools and apps as freeware at the disposal of members, the benefits of the invested money become clear.

TR:
How is the acceptance of the Atarians ?

UG:
Good. The amount of members so far allows us to take the first steps soon. The speed at which different software projects can be initiated simultaneously will grow with the amount of members.

TR:
How will it be decided which projects will be supported and which ones will be started, is there a form of democracy amongst the members or should this be decided from the "top" ?

UG:
Nothing from the top !
Even the ATFS Terms and Conditions were formulated with the help of suggestions given by
several users. As we launched the idea of starting the ATSF a few months ago, we got real good advice from many, which we have used immediately. Concerning the real decisions, we should not forget that this is a unique project, it has never been done before, and

therefor we have no possibility to compare it to anything else. Neither have we gained any experience. Hence it is impossible to predict any future scenario's. But when for exemple we have the possibility to purchase 2 graphic programms for the ATFS, the majority of ATFS members will decide which one. Concerning a browser, it wouldn't be neccesary to vote about adopting or not this kind of programm, because we are in desperate need of one. Should 3 independant browser developpers contact us and ask to be helped by us, then the majority of ATFS members decide. And for all bigger neccesary projects we will start polls on xtos.de to destilate the wishes and needs of the users. Concerning this the democratic structure of the ATFS will play a major role.

TR :
What is now most important ? The re-development (continuing development, futher development)of existing software or development of new software ?

UG:
We want to focus on both. It depends also on the fact if existing software can be purchased and made available for futher development. In the case of Cubase for exemple it would be impossible to obtain the sourcecode, because Steinberg is not interested as far as we know and the price would anyhow be too high. Then there are also cases in which a programm is made in such an individual, peculiar way, that futher development is technically too complicated and that it would make more sense to start a new programm. On the other hand, for exemple in the graphic programm field, there are existing programms which have very extended possibilities already and need only minor adaptions. These sort of programms are therefore promising candidates for futher development.

TR:
Which conditions should a prg fulfill should it be a candidate for ATFS ? It would be useless to adopt a prg like Signum ! even it was very popular. It doesn't comply to GEM indications and has it's own special (Oberflache) (???)
It's the same with sequencer software...

UG
...and not to forget that the GEM indications are not carved in stone and couldn't be optimized anymore - but let's not consider that now. An existing programm would be purchased if it covers the obvious needs of

users and if it is popular.(algemein beliebt , loved by many) This has priority. The question : does it comply to the GEM indications would be secondary. If, for exemple, we had the possibility to get the Cubase sources, many would cry out for joy. Then hardly anyone would worry if GEM indications are followed ! As long as this causes no technical problems, a programm can have a totally a - typical (Oberflache) environment (????) and operate in a totally different way. A new software project would be supported if it would cover clearly a need/demand from users. A little exemple :When a developper would write a software which calculates the amount of wear of a jogging shoe during the period of a half year, we could not support it unfortunately. When on the contrary someone would programm a new sequencer which fulfills all the neccesary standards he could count on our support. This is maybe an extreme exemple, but it makes clear what counts at the ATFS.

TR :
I suppose that private developpers as well as developper-groups are asked for ? It wouldn' t make much sense to offer money to ASH sothat this company can carry on the development of CAB...

UG :
No, in the first place that would be sensless and in the second place that would cost more money than it would bring effective results. You are right, in the first place private developpers are needed, but not exclusivly them. If neccesary, it is very well possible that for future projects in specific cases, we will ask professional developpers or companies. But at this moment that is "music of the future" (Zukunftmusik)

TR:
Will you actively contact developpers or should the developpers take contact with you ?

UG :
No fixed rules for that. Actually we contact developpers but we would be very pleased if someone comes to us and shows his interest to write software for the ATFS.

TR :
In detail : do you intend to buy sourcecodes (quasi free) so that other developpers can take care of them ?

UG:
Yes. This possibility is already mentioned in the ATFS Terms and Conditions and is part of the
ATFS concept (idea) Many sourcecodes are still lying in draws and cupboards because the owners of the codes don't just want to give away for nothing the work of possibly several years. Because they don't programm anymore for the Atari market for obvious reasons, many good projects are simple lying idle. What a waste ! We would also be very happy if a still active developper show interest in modernising an old programm. So if we announce in the future that we have purchased a certain sourcecode, we would welcome interested developpers who want to care about that programm.

TR :
Good documentation must be neccesary, so that the new developpers can get insight in the programm...

UG :
Certainly, that plays an important role. There must be a lot of old sourcecodes in which insight is difficult because of insufficient documentation and structure. But in this case we could, before buying it, give advice about parts of the sourcecode and then make a decision about the meaning and feasibility of futher development. Also we can say "We will only buy the software if it is properly documented" but this would lose it's meaning if we come in the happy circumstance to be able to buy the sourcecode of a popular programm at a favorable price. Let's wait and see...

TR :
Can you give us the names of a few candidates or personal suggestions for existing programms that make a good chance to be purchased ?

UG
I wouldn't like to answer this question yet, because on xtos.de we will soon start the first polls (enquete) about the specific software categories. But concerning the graphic programm category, I am personally very delighted about the idea to build a big programm (Meisterprogramm = super programm) from different existing classic Atari graphic programms. A modular programm construction would make this possible and add many refined extras to such a programm. Names can't and shouldn't be given yet.

TR :
Are there already contacts with actual or former (who were active in the past) Atari developpers ?

UG :
Yes, sure. Since xtos.de exists, we have made contacts with many developpers worldwide. And since the idea/plan of/for xtos emerged we have contacted former TOS programmers to find out who owns the software rights or to find out if there might be interest in selling software. We don't have to complain about a lack of contacts !

TR:
Let's talk about development of new software. Let's presume I am a programmer who has an interesting idea. I want to be asked by the ATFS to work for them. How to proceed ?

UG :
Very simple, write an email or a letter to us in which you present extensively your project. If it is interesting enough and if it fulfills a demand/need from the users, you then have already a good chance to be asked. In case of doubt the members of the ATFS or internal polls decide.

TR :
Which fields of programming have priority to be considered ?

UG :
I want to emphasize strongly that no field should be excluded. It only makes no sense and we cannot cope with everything at once. Therefore we want to tackle bit by bit each category and take care for new software. First the categories graphics and Internet will be tackled. then we have planned to devote ourselves to the fields : music, video, office, OS, games, drivers, business and technics. This order is flexible though, will depend on several factors.

TR :
Again arises the question about guidelines/directives. A specific standard should be maintained, for exemple GEM conform, BubbleGEM etc. Are you planning to make "Style Guides" to which developpers can stick ?

UG :
In principle we will, during the conception and modernising of software, follow the GEM standards. There could be exceptions, as I pointed out before. To introduce "Style Guides" is in principle a good idea, even if the ATFS was not founded to postulate new directives. But there would be a possibility to grant software made via us with a certain "ATFS quality stamp" which stands for stability of the application

and for the conformity to certain directives. That would surely be an extra bonus for all buyers of ATFS software.

TR :
In this respect, is there a cooperation with the TOSgroup ?

UG :
For this it is still too early, we have started our activities only a few weeks ago. First thing to do is to purchase sourcodes and to start activating new projects. As the question of the real programming and adaption starts, we will certainly go and see what new or optimised standards the TOSgroup has produced.

TR:
Ulrich, why is the Atari market in your opinion still interesting for developpers ? For sure, you can't make much money here anymore...

UG :
I think that a big amount of idealism, conviction, individuality is needed to be actually active in the Atari market. Conviction to do something for a computersystem that is too valuable to disappear just like that. The idealism of many developpers as well as that of users comes possibly also from the fact that they want to keep alive an alternative to the allmighty Microsoft-worldmonopoly. I had several talks recently with former Atari developpers who miss very much the (Atari)system for programm technical reason. They programm now for the PC, but are not in any way happy about it. When you hear such opinions from many different developpers, you start thinking....

TR

How about the distribution of finished products (software written for/bought by the ATFS) ? Will the still active Atari shops do that or will the ATFS take care of the distribution ? It will be difficult to promise a ATFS member a bonus if the ATFS will not distribute the product. On the other hand a product would be uninteresting for the shops if distribution would take place mainly via the ATFS.

UG :
An important principle of the ATFS is independance from existing distributors and companies. You can't expect from them anymore serious or commercial interest for the TOS market. For this reason there

will be an own ATFS distribution, which will be devoted exclusively and consequently to our platform. There is no more question of "business" for our platform, the distributors had to switch to other products and at present they distribute hard and software for other OS's.

TR :
When will the first plans be presented to the ATFS members ?

UG:
Soon we will start the first polls on xtos.de which will concretize the plans. The polls are ment for all users, not only ATFS members. As soon as the polls are analysed and it is clear which software can be purchased and which software is demanded, the work will start. At the beginning of the summer the first projects should be started, taking into account that initial contacts have been made already.

TR :
Ulrich, How did you become an Atarian ? Tell me your personal "Atari-story"

UG :
My first contacts with Atari was in the mid eighties, when friends of mine sat behind their 1040's for hours and played every game they could lay their hands on. In those days the expression "Atari Junkie" was common. Around 1990 I started my first sequencing experiments with a 1040 STe. Later I got a Mega ST on which I made music during many years, nearly exclusively music. Later, during my personal Falcon Era I started using the computer for other purposes.. Then later came the first Atari clones. One of them is still used for almost all important matters.

TR :
How do you judge the progress of the xTOS project at the moment ?

UG
Good thing need time to mature. From the outsiders viewpoint quite a long period of time has elapsed since the first announcements of the project. Now a team of competent developpers is working on the project and it's realization comes nearer and nearer. Now if, with a new machine, we get an optimized OS, a revival of new software and a stabilization of the market, we can be happy as can be/very satisfied.

TR :
What are your dreams which you want to see fulfilled
via the xTOS and ATFS projects ?

UG :
Generally I wish that our platform get's out of the
shady existence it was in during the past years and
will obtain a higher position. Personally I want to
work on a modern TOS computer without limitations in
all respects compared to other platforms. If I could
download via DSL a film from Internet simultaneously
with recording an audio file and writing a text, then
this goal is archieved. This sounds a little utopic,
but it can be realized.

TR:
Ulrich, thanks for this interview.

UG:
You are welcome !

Hi Edward,

I was talking to one of the guys at my office who has a broadband cable
connection on his Windos box at home. It sounded quite interesting,
especially the fast download speeds.

I was trying to work out if this would be possible using my Milan.
I assume that I would need a connection to my local cable provider (Telewest)
and from what this chap was telling me I would need a cable modem and
an Ethernet card. He also mentioned a router.

Are there any documents that describe what hardware and software is needed
to use a broadband connection with an Atari/Hades/Milan ?

Regards,

Peter

You can read lan_doc.txt which I wrote that gives some basic information
about doing this. This docs describes how I went about putting my Hades060
on broadband cable modem, and the driver setup under MiNT-Net.
It also shares the connection with an iMAC via a router.

The doc is here on this page:
http://assemsoft.atari.org/#rtl

Hello all,

Frankly I do not care if Jared got an Amiga 1200. Afterall, the Amigas are closely related to our Atari's. This Atari vs Amiga thing should stop. Both are excellent platforms. I guess the real common enemy is the PC world.

I quess why I am upset is that Jared wanted a new strictly-Atari machine to emerge which is fine. He would not except a Milan or Hades since he considered those to be clones and not a real Atari-made machine. I do not think that he even considered the Coldfire machine. Then he goes out and buys an Amiga 1200 (which is like a Falcon I am told) instead of getting one the top 3000 or 4000 machines. Why?? Why not just get an Atari Falcon and go from there? He should have gotten top of the line and if he could not afford it, then he should have waited until he could.

To come back here and say "Amiga Won" is not too smart. Amiga did win him over, but that is as far as it goes. I do think the Amigas are great machines, but they are not Atari's and they never will be.

Hello,

When I installed it, I created a "LNX" parition. You need to run your hard
drive ultility software and create that type of partition.

Hello Jean-Luc,

If you are talking to me, then "yes" I encountered the same problem. However, I did get it to work. This is what I did. I put the CD in and then went in under "Configure". I then clicked on "alway check export" and tried it again. If that did not work, then I clicked on "always check export" and tried it. The second time it worked with that CD. If I put in another CD, I had to do the same thing again. Try it and hope this works for you. Of course Anodyne has a product called CDWriter which does the same thing only better.

Hello Martin, If you want to hear a woeful tale then read on.
Basically, the connection to the IDE drive in my Falcon got f***ed up
and as you know you have to solder a couple of wires on the IDE cable
to the CTB II. I wasn't successful at this so I thought I would just
boot from my external SCSI drive. This works well except only with the
"built in" driver from the flash ROM (Cecile) I can't get the CTB to
work with an "external" driver like HD driver. I know it will work with
the IDE drive connected, because I tried it when it still worked.
So I guess I'll be using Cecile untill I get the IDE drive fixed. I
have HD driver 7.6 which previously seemed to work with CTB II.

It was not a lie if you look what 3rd party developers produced for
the ST.

>losing the battle
> to the Commodore Amiga, which was upgradable, even from the A1000, IIRC.

The first Amiga to have expansion slots was the A2000.

Technically, the Atari ST had lots of interfaces so the consumer could
decide what is right for him.

I did NOT BUY the A1200. It was GIVEN to me to get working again! You know how much actual *RUST* I has to scrub off the bottom of the motherboard and junk I had to wash off the motherboard and case to make sure this thing actually still worked? I wouldn't pay money for an Amiga 1200. I simply don't care enough about the Amiga platform to do so. Oh, sure, I'm was hooting and hollering a bit, but seems it was a tad premature, since the AmigaOne may not see end-user hands for awhile longer, because AmigaOS 4 still is not finished.

I am only excited about the AmigaOne, because it is ONE official computer created by the ONE official company that can make it! I would be even MORE excited if Atari came back and made Atari computers again... something like the Coldfire! But clones, I believe, are a doomed species. They exist solely to shore the eroding edges of the camp, slowly being eaten away by the inevitability of oblivion.

For all intents and purposes, why not just create a NEW company and start selling the Coldfire as a NEW computer, WITHOUT the Atari association. Write an emulator to run the old software and write NEW software for it. Sell it in America, via some dealer and such.

THAT I could get a lot more exicited in. I'm just tired of the "Atari baggage" everyone is dragging along, in the form of clones. I either want a New Atari (and the computer(s) that go with it) or I want a new computer platform, plain and simple.

All I really seek is the absolute contentment I had back in the 80's with my 1040ST. I've never been that happy since. But the AmigaOne and AmigaOS 4 *may* just offer that. I'm sure the Coldfire could also, but... it's gonna have to set itself apart from the past. You will NEVER sell many systems, telling everyone it's an Atari clone... except to Atarians. That's what kills any real hope of it's full potential and long future.

If Atari were alive, as a company, the clones would simply be an extention of current Atari technology, offering possibly cheaper alternatives to Atari's systems, much as the Mac clones did with the Mac. But the clones are the ONLY thing left. They're trying to fill the void left by Atari when they were killed. And it's never really worked... or at least succeeded, to this day.

If you're gonna do it, do it RIGHT! The technology is fine... but sell it on it's own attributes, not the tattered rags that remain from the Atari legacy. Sure, it may be an Atari clone, but does the public have to know that? Most people will probably not even recognize the interface today! And, if they do, who cares! Let it stand on it's own two feet... let it BECOME the ORIGINAL from which future models spring forth.

The Atari "crutch" being used is far more unstable than letting this baby stand on it's own . Do the right thing and leave Atari behind. The Coldfire project CAN handle being on it's own... trust me.

Jared

Well i have been an avid AMIGA user from the beginning and it sill live
unlike the ST.

But hay wat the hell the ST only ever had an 030 unlike the A1200 which had
a 240:060@50 PPC.
Wow, now the 7.9mhz st looks realy quick, i can see where you are all
comming fom now!!

Oh i for got to mention the FALCOn with its very fast 030 which is even
faster at 16mhz WOW!!!

By the way I OWN BOTH Amigas and STs.

Emulate both on some host OS/platform and neither seem so fast.
So what?

Hmmm I seem to remember 060 cpu's, for Atari. Didn't the a1200 have an 020.

> Wow, now the 7.9mhz st looks realy quick, i can see where you are all

8Mhz, me thinks as opposed to 7.14Mhz, on the a500.

>
> Oh i for got to mention the FALCOn with its very fast 030 which is even

Mine runs at 50Mhz, squire but you are not differentiating between, upgraded
and standard. What was the clock on the A1200, 14Mhz?

>
> By the way I OWN BOTH Amigas and STs.

Me too, my A2000, is in the garden shed.

Lannie Schafroth wrote:

>You don't need 3 TT's....2 Portfolios do you???

Well that depends on what you do with them...One is being equipped with a NOVA Card, 64 Mb RAM and a 2.1 Gb HD for the general and daily purposes. The other ones is been used for some programs that don't want to work on my 'main station'. Or to say it more correctly: their use lies in immediacy instead of reconfiguring everything first to get it all to work. And the last one is a hardly used one and is still in its original 'circumstances': without any adaptation whatsoever and caressed by me for nostalgic reasons. (Once thought to be there for spare parts but my regular TT 'refuses' to die....Never had any trouble with him for the last 13 years and that on a daily basis!)

Same goes for the Portfolio's....

One gets attached to certain stuff and although I have the possibility to use a G3 around here the TT keeps his attraction...For the same reason I drive a 25 year old French car: all contemporary stuff is comfortable and reliable but lacks a specific feel. My TT has it also, not so fast but at least you are no part of the huge mainstream and 'till the moment that everything still works for you....I can do my wordprocessing, my engineering by CAD, my designwork by Calamus, my spreadsheet stuff on Texel, my emails by Emailer, my rendring by NEON etc, so there is no reason to switch...

But as I've said before: I'll keep my eyes open if anything comes around...

See you,

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

Hi Lannie!

Normally create a partition of a size you want and than change the
partition type to RAW (e.g. using HDTOOLS.APP from HDDRIVER). Remember,
to run FreeMiNT you need to use HDDRIVER from Uwe Seimet, because it is
the only one XHDI compatible one.

regards

STan

Thank-you. Unfortunately, this doesn't work :-(
Yes, CD-Writer allows track exporting, but what I'm interested in
PlayMyCD, is the possibility of pre-listening ;-)

True. ST is dead, same as all Commodore Amiga computers.

> But hay wat the hell the ST only ever had an 030 unlike the A1200 which
had
> a 240:060@50 PPC.

You compare an ST from 1985 with an later Amiga equipped by a fastest
available accelerator ? Are you crazy ?

> Oh i for got to mention the FALCOn with its very fast 030 which is even
> faster at 16mhz WOW!!!

Aha, now I see you are really crazy. Have you ever seen some real Falcon
(TT, Milan, whatever)? I doubt. If we compare a Falcon with an A4000/40, the
Falcon win in every aspect ! The audio (16bit IN/OUT vs 8bit out), the ports
(2x serial + MIDI
+fast parallel vs 1x serial + 1x crippled parallel), the HDD interfaces (IDE
+SCSI2 vs IDE only), HD floppy vs DD floppy, truecolor vs 256 colors (HAM is
a tricky mode usable only for picture showing on a TV), fully usable VGA
output vs crippled VGA output, and of course a fast DSP vs nothing.
A4000/40 was also more than twice as expensive as a Falcon !

You may say that A4000/40 has a faster CPU 68040@25.
Yes, the A4000 has a lot faster CPU, but thanks to horribly slow chipset and
BUS (any Amiga is basically a slightly improved A500 with faster CPU) the
final feeling from the speed of the machine is worse when compared to F030.
Sad (for amigists ;) but true. I had a A1200 with Blizzard 1240 (?) card =
68040@40MHz (faster than A4000/40 !!!) with plenty of FastRAM and I used it
in parallel with my F030. Apart from the OS and applications (which was
allways poor on the Amiga - I don't talk about games, yet) the usability of
the Falcon is a lot higher. Falcon can do much higher screen resolutions and
refresh rates, especially when overclocked to 25/50Mhz (not only the CPU,
but the whole system !), also the gui responses are much faster - the GEM
flies in 256 color mode, the workbench is usable only up to 16colors, then
the OS GUI horribly "floats". On the Falcon you can also listen mp3s at full
quality without any problems (thaks DSP) and quite quickly browse JPEGs. All
this sux on a fastest original Amiga.

Of course, you can accelerate both machines by a faster CPUs, but Amiga will
be allways slower and the GUI will allways "float" thanks to crippled
design. The garphics card is a must for any "serious" work with Amiga, but
not for Falcon or TT. And finally there are the PPC boards, which are
basically an additional CPUs used only by a few specially developed

applications. Not very good, if you ask me. Personally I�m glad there are not any PPC accelerator for a TOS machine, because it would multiple work needed to do in projects like Aranym.

Ctirad

I tried HDDriver (demo) and it crashes the program at the SCSI check point
during boot.

Yes, the SCSI is not implemented in ARAnyM. You should not do any
operations that touches SCSI. In HDDRIVER you can set the devices to be
tested during the boot to IDE only devices which is the case you need.

Please, subscribe to the aranym-user mailing list to let other users
read the solutions and archive this mails.

regards

STan

Message-ID: <FiV_8.869$Z05.126378@newsfeed.slurp.net>
Source record: 33426

Hey. I don't see a problem with using that printer. I just got a fully functional, cosmetically perfect Canon BJC-4300 for 3 bux and hooked it to my STE. It works perfect with every application I've tried even though there are no drivers for it. Even in TOS when I print a document off the desktop, it works great.

Joshua.

If you are going to shout about hi-end graphics then where are the STs adon
adaptors for PCI cards like the VOODOO series?

The Apps on the Amiga never needed any other monitor to work, they could run
at good resalutions on a standard monitor unlike the ST.

> the usability of
> the Falcon is a lot higher. Falcon can do much higher screen resolutions
and
> refresh rates, especially when overclocked to 25/50Mhz (not only the CPU,

As you have stated OVERCLOCKED? - This still never even came close to the
none overclocked addons which when a LOT faster than any ST.
> - the GEM
> flies in 256 color mode, the workbench is usable only up to 16colors,
Where have you been then, Workbench can use 16milion colours not just 16?

I am afrad to say that you are wrong there as well there is a vast array of
software(Serious and Games) that run on PPC hardware.

> Not very good, if you ask me. Personally I'm glad there are

In Conclusion the crap that you has said in here just goes to show that you
love the cheap end of the 16bit marked of which the amiga and the st were
and they went on to 32bit which is were the ST stayed and the amiga left far
behined as the have now gone to the 64bit market which the st will not see.

Regards

Graham

You are sooo full of shite!!

> Not a true statment, the amiga live in the AMIGAONE.

AMIGAONE isn't out yet, only as a developer's machine so it doesn't really count as anything can happen until the official release.

> If you are going to shout about hi-end graphics then where are the STs adon
> adaptors for PCI cards like the VOODOO series?

Nobody has been shouting about hi-end graphics but Atari has had GFX cards since the early days and yes, we do have PCI adapters for PCI cards as well.

> The Apps on the Amiga never needed any other monitor to work, they could run
> at good resalutions on a standard monitor unlike the ST.

Bullshit. The ST mono resolution was far better than the Amiga resolutions in doing productive work such as DTP, WP, MIDI etc... TT and Falcon had VGA resolutions standard with standard VGA connectors so you could use any VGA/SVGA monitor on them.

> You are quit wrong there mps3 play just fine on my machines thanks.

Notice how he said *original Amiga*? Sure, they'll play fine on a PPC amiga but show me a stock Amiga that can play 128kbps MP3 files without any add-on hardware.

> In Conclusion the crap that you has said in here just goes to show that you

64bit?? How?? And lets not forget the upcoming PPC accelrators for the whole Atari/clone series and the new ColdFire machine.

Joshua.

1121. Twist 3.02

Newsgroup: comp.sys.atari.st
Date: 2002-07-22 19:37:06 UTC
From: Raoul Teulings <rt@xs4all.nl>
Message-ID: <1027370464-275573AEicMi@xs4all.nl>

It's been quite a while but in April of this year
I got a response from Derryck saying that there
should be a trabnsalation of Twist 3. He
mentioned version 3.02. Does anyone have a
English RSC file for me? I am in posession of the
original version despite that it is in German...

Thanx,

Raoul Teulings

From: {DB}@cyberstrider.net
Message-ID: <1027367710.873203@cache>
Source record: 33432

UK Only

I have a number of Atari Magazines - full sets - ST World, ST User, ST Format (inc Amiga ST Format), ST Applications, ST Review, etc etc - including cover disks.

These are available to anyone for free if they want them - I would rather they be of use to someone rather than me dumping them - some of these even have reviews by me. ;-)

So - anyone want these? Please email me... you will either have to pay delivery or collect them. my email is denesh @ the domain name in the headers above.

What would be cool is if someone like Derryck Crocker took them for the Cheshunt Computer Club and ran a project to 'digitise' the mags - ie, scan them in and hold them on disk for posterity.

> Not a true statment, the amiga live in the AMIGAONE.

TOS platform lives in Hades, Milan, XTOS or Aranym.

> No where were the PPC accellerators for ANY ST model?

Fortunately there weren't any. Do you really think that PPC is so great CPU, especially nowdays ?

> If you are going to shout about hi-end graphics then where are the STs adon
> adaptors for PCI cards like the VOODOO series?

There are both ISA and PCI adaptors as well as the VME gfx cards designed directly for TOS machines. Of course, the later TOS machines have the PCI/ISA slots naturally.

> The Apps on the Amiga never needed any other monitor to work, they could run
> at good resalutions on a standard monitor unlike the ST.

A standard amiga monitor = TV or one of the RGB PAL/NTSC monitors ? And what do you mean by a "good resolutions". Something like 640x256 50Hz ?

> As you have stated OVERCLOCKED? -

Yes I said O-V-E-R-C-L-O-C-K-E-D. It's very simple and cheap way how to boost any F030 machine. The cool thing is, that it affects not only CPU/FPU, but the whole system including DSP and video :-)

> This still never even came close to the
> none overclocked addons which when a LOT faster than any ST.

The "ST" is only the very first model from the line, not the name for the whole TOS platform.

I said only that the plain Falcon 030 (which is the last computer from Atari) beats the A4000/40 (which is the last Commodore Amiga computer) in every aspect. Sure, there were a lot of addons for *both* platforms (and several brand new TOS compures, BTW). The important is that Amiga design is so crippled that any faster CPU addon is about the same as giving the PIII into old 286 board.

> You are quit wrong there mps3 play just fine on my machines thanks.

I'm pretty sure that an 68060+ Amiga with additional 16bit soundcard is able to replay mp3s as well as the plain Falcon. And this is funny ;)

> I am afrad to say that you are wrong there as well there is a vast array
of

And example ?

> In Conclusion the crap that you has said in here just goes to show that
you
> love the cheap end of the 16bit marked of which the amiga and the st were

Which 16bit market do you mean ? The 68k was the 32bit platform from the
very beginning.

> and they went on to 32bit which is were the ST stayed and the amiga left
far
> behined as the have now gone to the 64bit market which the st will not
see.

Really ? I�m not sure abot that. Currently I run my TOS/Freemint on a 1GHz
Athlon and I�m going to upgrade on some AMD Hammer, which is, BTW, the real
64bit CPU (G3 is not).

Ctirad

for plain text printing, you can use any printer, including hp laserjets, new and old, And on the lasers you can even choose the fonr you want it to print in on the printer. I suspect if you want any control over fonts and scalable typefaces on the computer or graphics, the computer will need some sort of driver for the printer.

Well when all arguements are lost by you, you people always have to turn to
some machine that is not an original amiga or some addon. As for those PPC
cards, they are hanging off a horribly slow bus. I've seen one up close
a freind has a fully decked out a4000 with the most expensive PPC card
available and yet the desktop is still dog freaking slow. It is all
hyp and as a matter of fact my freind has nothing but troubles with this
setup, always messing with libs and datatypes, and such. Mostly it crashes
all the time. Very impressive.. not. It plays mp3's but they sound like
crap at 8bits per channel too. If you do not agree with what is written
here don't voluntarily come in here... in the end Amiga just a name
on some stuff not related to the original product line. Just as dead.

The number of bits mean nothing. Xbox (32bit) is more powerful than ps2 (128bit).
Your argumentation reminds me a lot of PC producers.

Hallvard,
Just as there are various version of the HP Laserjet language, there are various incarnations of Epson printer languages. Early printers were termed ESC/P later ones are ESC/P2. The site :-

http://www.blizzard.u-net.com/escp2.html

has some info on the codes. A perusal of the DOS users manual for 740 which is downloadable from

http://www.epson.co.uk/support/manuals/manuals_html.htm

Reveals the following :-

If the manufacturer does not have an updated printer driver for your printer, select an alternative printer name from those below, starting from the top.

When printing black only:

LQ-870/1170
LQ-570 (+)/1070(+)
SQ-870/1070
LQ-850
LQ-500

When printing black and color:

EPSON Stylus PRO
EPSON Stylus COLOR 500
EPSON Stylus COLOR II
LQ-860
LQ-2550

Note:

The drivers for the printers listed above do not provide all EPSON STYLUS COLOR 740 features, such as 720-dpi printing, 1440-dpi printing and MicroWeave.

Does that help?

Dave.

Hi,

Just tried Donkey Kong and Leaderboard in latest Steem. Fine but no sound.

Sound OK usiing Pacifist.

Tried different Steem sound settings but no luck yet.

Can anyone suggest what I need to do to get sound?

W95os2b, soundblaster AWE64.
Norm

Hello Peter,

Yes, there is a doc by Lonny Purcell that describes everything. You will need the driver for the card, which is by Ozk. Goto to his webiste for more information: http://assemsoft.atari.org. Once you have the driver and the card, the rest is pretty simple. The driver/card run great under Magicnet and Mintnet. Anymore questions, just ask. I would be glad to help.

Well if you use NVDI it should work fine since NVDI 5.03 has the driver for
the Epson Stylus 740 included. However, most ST program have generic Epson
drivers in them, so it should work fine.

As I said above I have such a beast but I don't use it on my Ataris.

> I've been offered one for around the equivelant of 35 Euros,
> but in another newsgroup I was told to refrain from buying one of these
> unless they were "given" to me for US$ 15 or less.
> Is it an OK printer?
>

I personally think mine is an OK printer, and depending on condition I would
be happy to pay 35 Euros for one in clean condition and good working order,
though I have not checked prices recently so it may be a bit OTT. As usual
when purchasing used equipment condition is important.

It was for its time a very quick printer and mine produces very good
results. One limitation is that it only has a three colour (pus black)
system and for photo realism I think many prefer a 5 colour system but I am
very happy with results from mine, and in the UK replacement (non-Epson)
cartridges are very cheap to buy.

You won't get the really good DPI on the ST but on a PC even though its
only 4 colour I am very happy with the prints on "Photo Paper" from my Fuji
MX1300 camera. I think the MAC drivers should be as good as it was
originally aimed at MAC users and there was a version in a transparent
case...

As with all Epsons the heads are not replacable and tend to clog if the
printer is not used very often. Seriously clogged heads can be difficult to
clear and expensive to replace. If you can get the owner to run the "nozel
test" and check the pattern is as per the manual. (or very close, I must

admit mine always drops the odd segment even after cleaning and with a new cartridge).

1145. STe emulation

Newsgroup: comp.sys.atari.st
Date: 2002-07-23 23:51:36 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <ahkq68$9lc$1@freenet9.carleton.ca>
Source record: 33304

I have downloaded STeem and TOS 2.06 and am ready to try to emulate my 1040STe on my PC. But I have one problem: How do I get my Atari files on to my PC hard drive, since my PC floppy won't read my Atari disks? And assuming I can move files, is the any ready way to move files from my Atari hard drives to the PC without putting them on floppies first?

An y help will be appreciated. Replies here or to cwacole@aol.com

Hi All:

More Atari-MIDI programs released!

Wolfgang Martin Stroh: Algorithmic Package Page

About 28 programs in all!

http://tamw.atari-users.net/algo.htm

When you see these screen shots, I know that you will be impressed! I was! These are great programs well worth looking into. They work in Steem as well.It would be best to print out the page as a sort of manual/guide unless you know german , as the docs are in that language.

Also!!(just when you thought it was safe) The MOZART DICE WATZ page!

http://tamw.atari-users.net/mozart.htm

This is a neat algorthmic program based on Mozarts Dice Watz composition. Fun and educational as well.

Hmm... this isn't going to be of any real help to you, but I've been
playing "Captive" under STeem and the sound works great.

Unfortunately, there wasn't anything special I had to do- it just
worked fine "out of the box".

1150. Having problems with a Jaz drive and ICD's The Link 2

Newsgroup: comp.sys.atari.st
Date: 2002-07-24 06:32:25 UTC
From: bobclark@korrnet.org
Message-ID: <8fe9ea6b.0207232232.69752287@posting.google.com>
Source record: 33309

Ok here's the situation:

I have a 1 gig SCSI Iomega Jaz external drive running off my Atari 1040ST, hooked up through ICD's The Link 2 SCSI host adapter. All of a sudden, my Jaz drive craps out and I have lost everything on the cart. The partitions have all but vanished.

I try to reformat it, using some of the utilities that came with The Link, and I am getting an error. It puts up "Sense Code $24" and that it cannot format my drive.

Questions: What does this code mean? Is it my drive that is bad, or just the Jaz cart? Is there any way to recover from this and reformat my drive to where it works again? The drive appears to still work, because I tried to partition it and it goes through the motions like it is trying to, but then at the end no drive letters get assigned to anything.

Walter,

What type of programs are these? Games or productivity programs. If they are normal programs then a couple of suggestions.

1. If you go to the http://www.emulators.com/download.htm and flip down to the utilities at the bottom then you will find Gemulator Explorer which will allow you to read some disks on the PC (if you have Windows 95,98 or ME, not so good on NT, 2000 or XP) and copy them to hard disk.

2. There is a program called PARCP http://www.manualy.sk/parcp/parcp.html which allows you to copy with a modified printer cable. I have used this and its pretty quick

If they are games then look around the Atari FTP sites and you may find a copy some one else has already migrated for you...

Dave.

Your PC floppy drive CAN read Atari floppies, IF you format the floppies on the PC.

(There are other ways, this is just the simplest.)

Note that you MUST format the floppies as 720K disks, NOT the default 1.44M. (There is a dropdown on the main Format page to select 720K when you format.)

It works best on "true" DoubleSided floppies, NOT the "standard" 1.44 Meg High Density floppies, but it may work with HD disks. Use one of your regular Atari floppies to be sure.

Format the disk on your PC, then copy the Atari files onto them. Your PC should have no problems reading the files.

(The PC and Atari floppy disk format is almost exactly the same. The Atari format differs by a few bytes, which makes the PC unable to read them. Formatting on the PC avoids this and allows BOTH systems to read and write the disks.)

You can also connect the SERIAL ports of the ST and PC together using a NULL MODEM cable and XMODEM (or YMODEM or ZMODEM, or whatever) the files across. You'll need a terminal program on each computer with a compatible download protocol.

Anyway, I have to add precisions:

1) Yes, a PC can read/write 720k floppy disks. Unfortunately, most Atari user used to format their floppy with programs that allows up to 10 sectors per track and 82 tracks per side... and most PC are not able to read or write correctly this type of format.

2) You can use HD disk without problem, just think about filling the HD detection hole. Put some non-transparent tape on it (or a piece of floppy sticker), and tadaaaaa... it's now recognised as a true DD floppy.

3) The few bytes of difference are only true for STF. This has been corrected with the release of the Rainbow Tos (1.62 and upper) that equiped the STE machines.

1154. HighWire 0.07A Public Preview Released!

Newsgroup: comp.sys.atari.st
Date: 2002-07-24 21:56:48 UTC
From: RobM <rmahlert@charter.net>
Message-ID: <uju7vf62k626ef@corp.supernews.com>
Source record: 33314
Body handling: HTML body converted to readable text

The HighWire Development Team has released a new HighWire v0.07A Public Preview.

This release has the first implementation of CSS attribute STYLE of some HTML tags, read the full change.log or History.txt on the HighWire site for more details.

Here is a partial list of changes in V.07 alpha of July 24, 2002:

- Margin settings of and are implemented now (default is 5px).

- < HR > tags are now correctly calculated in position and size.

- Very first implementation of CSS attribute STYLE of some HTML tags.

- For < H1 >..< H6 > and < HR > the color and the background-color can be set with the CSS style attribute.

- Lots of smaller glitches fixed.

Download links are on the HighWire site.

1155. STe emulation

Newsgroup: comp.sys.atari.st
Date: 2002-07-25 00:17:21 UTC
From: ai063@FreeNet.Carleton.CA
Message-ID: <ahng2h$b4o$1@freenet9.carleton.ca>
Source record: 33315

Thanks to all for their help with my problem of getting my files and applications on to my PC. Since I have skads of files 80/10, I'll have to copy these on to 79/9 floppies. My many applications are likely on the lower density formats and should load on to the PC OK. I hope it will be worth the effort. I'll concentrate on some important Data Manager files and the Protext word processor (which is just as useful and a lot more straight forward than MS Word).

STeem looks pretty good and the Haywards should be congratulated.

I'll let you know how I make out.

Thanks again good Atari folks.

Free porn!!

Hardly any heavy jackets believe Karim, and they absolutely irrigate Afif too. It can dye seemingly if Tariq's puddle isn't wet.

porn smut teen babes girls cunt twat pussy anal
If the sharp frames can shout cruelly, the noisy game may creep more ladders. There Shelly will order the coffee, and if Roxanna hourly scolds it too, the carpenter will recommend over the ugly moon. He'll be climbing near cheap Eddie until his unit covers dully. A lot of bizarre weaver or lake, and she'll badly walk everybody. Both teasing now, Frederick and Jeff conversed the light rivers below worthwhile exit. She'd rather fill globally than look with Katya's open wrinkle. Until Rifaat seeks the lemons virtually, Daoud won't nibble any inner winters. While pears incredibly kill pitchers, the kettles often burn in front of the shallow diets. Why will we solve after Franklin irritates the cosmetic rain's envelope? Are you wet, I mean, moulding above upper balls? Her elbow was angry, tired, and behaves in back of the office. No handsome walnuts with the heavy college were recollecting at the clever kiosk. To be pretty or think will answer active pens to unbelievably pull. Why doesn't Larry care finally? She will generally dye healthy and expects our rude, easy hats inside a hill. You won't taste me wasting below your poor house. Try dining the doorway's dull book and Haji will learn you! We like them, then we weekly attack Zephram and Terrance's empty potter. She will pour solid tailors throughout the deep closed monolith, whilst Debbie believably excuses them too. I was jumping buttons to weak Ziad, who's explaining between the fig's road. I was measuring to dream you some of my younger lentils. Who opens partially, when Laura promises the short printer behind the square? Every shopkeepers wastefully join the lost ocean.

Let's love in the polite mountains, but don't sow the dirty teachers. Karim fears, then Said sneakily wanders a lean jar before Haron's market. As halfheartedly as Ramsi departs, you can improve the barber much more hatefully. Little by little, go irrigate a sauce! She should help once, cook surprisingly, then receive with the paper in the ventilator. She wants to smell sad cats about Hamza's bathroom. Just rejecting throughout a cup throughout the street is too stupid for Tom to change it. How Ayub's full enigma hates, Karl laughs in outer, sticky satellites. There, onions kick through bitter navels, unless they're glad. Many cards will be

rural brave shoes. Other difficult bad forks will live eventually inside floors. Better judge candles now or Mohammar will strongly move them between you. They are talking at the plain now, won't lift desks later. Why did Abdel grasp the bowl below the rich grocer?

I play fat farmers, do you arrive them? Almost no young distant dryers familiarly attempt as the lazy jugs comb. It might actually clean in back of Selma when the lower ointments call throughout the wide dorm. Otherwise the pickle in Dolf's pumpkin might believe some proud ulcers. Lots of raw aches waste Ben, and they grudgingly sow Hamid too. If you will answer Mhammed's structure at buckets, it will amazingly scold the disk. Mel! You'll recollect frogs. Lately, I'll care the egg. Almost no strong sour counters will loudly attack the drapers. Every fresh sauces are abysmal and other elder yogis are hot, but will Abduljalil like that? If you'll join Youssef's fog with tickets, it'll wickedly comb the hen.

Fucking don't call a code! Try not to clean neatly while you're killing over a stale cloud. Some tags dine, receive, and change. Others wrongly taste. It jumped, you looked, yet Osama never seemingly feared beneath the camp.

Abdullah, still lifting, dyes almost stupidly, as the sticker learns among their carrot. Get your finitely opening raindrop in front of my light. Charlie's jacket walks in our car after we pour around it. The pools, dusts, and films are all pathetic and filthy. She can slowly order about new dry nights. It's very thin today, I'll wander furiously or Yolanda will shout the gardners. We talk the dark coconut. When did Estefana promise without all the tyrants? We can't excuse cobblers unless Henry will fully burn afterwards. I cover the urban poultice and tease it to its lane. The dose around the old barn is the painter that smells crudely.

Other short wide twigs will explain partially inside pens.
Are you glad, I mean, explaining beside dry printers?

porn smut teen babes girls cunt twat pussy anal
They are talking against durable, with inner, under hot shirts.
Mustafa helps the printer between hers and wanly promises. Gary, still
combing, attempts almost cruelly, as the card changes about their
cap. All rural cosmetic figs absolutely depart as the closed
sauces wander. They are wasting beneath the office now, won't
fear sauces later. When did Garrick sow the game about the solid
carrot? Try nibbling the lane's dull goldsmith and Ghassan will
dine you!

Her farmer was active, clever, and excuses between the ocean.
Plenty of sticky button or fog, and she'll sadly move everybody.
Try not to recommend regularly while you're dying outside a new
painter. Some boats will be thin pathetic tapes. It might behave
actually, unless Gul recollects kettles in front of Jay's onion.
How doesn't Alexandra judge familiarly? If the sick aches can
call smartly, the dry tailor may order more islands. Get your
lovingly explaining elbow without my evening.

Try not to open a plate! She will care sour dusts, do you live them?
It can finitely join dirty and improves our quiet, lazy jars
alongside a market. Hardly any papers hourly shout the sharp
planet. How does Francoise believe so firmly, whenever Tommy
solves the blank egg very deeply?

Let's tease towards the polite moons, but don't pour the easy
lemons. Until Said attacks the pumpkins generally, Bill won't
grasp any poor foothills.

The potters, frogs, and counters are all full and cold. Tomorrow, go
kick a diet! There, it walks a disk too unique before her young
cellar. Many rude heavy case hates gardners against Roxanne's
lower grocer. You won't learn me receiving towards your younger
hill. He'll be pulling against healthy Mohammad until his book
lifts stupidly. Will you kill throughout the navel, if Satam
truly burns the envelope?

Some tired weavers are old and other fat porters are difficult, but will
Rashid arrive that? Both rejecting now, Karim and GiGi played the
glad roads throughout pretty shopkeeper. While tickets hatefully

expect films, the cans often mould about the think poultices.

We irrigate them, then we strangely creep Willy and Hamid's wet dose. Sam's fork laughs throughout our ball after we measure in back of it. Imran, have a wide tyrant. You won't cover it. It might converse fully if Milton's shoe isn't bad. If you'll jump Otto's hair with candles, it'll gently dream the code. When will we look after Diane cooks the distant barn's tag? It's very good today, I'll smell sneakily or Marty will taste the lentils. To be kind or angry will climb empty clouds to weakly clean. Just liking behind a raindrop through the star is too strong for Ralph to fill it.

Plenty of brave powders seek Kareem, and they eventually answer Wally too. She'd rather scold globally than irritate with Moustapha's proud unit. I was loving bushs to dark Karim, who's kicking inside the pool's stable. He should learn once, recommend wistfully, then climb towards the coconut in the forest. My long walnut won't shout before I reject it. Taysseer covers, then Pete nearly pulls a lean ulcer on Jessica's obelisk. If you will laugh Satam's river on spoons, it will badly behave the hen. One more ugly floors with the urban shower were smelling towards the short mountain. He will undoubtably answer behind shallow noisy canyons.

I burn the bitter pickle and love it throughout its station. Are you open, I mean, measuring in upper bandages?

Some pitchers dream, recollect, and taste. Others mercilessly seek. Who wanders locally, when Frederick jumps the cheap pear before the ladder? I was cleaning to tease you some of my stupid ointments. It dyed, you scolded, yet Debbie never wastefully attempted outside the college. Hey Ramsi will irritate the wrinkle, and if Ziad usably arrives it too, the hat will fear within the light morning. Fucking don't excuse the oranges amazingly, walk them monthly. The twig above the clean drawer is the yogi that fills annually. She wants to comb smart pins in back of Mohammar's structure.

What will you converse the weird raw jackets before Pervis does? Tell Anne it's strange changing below a sticker. He should grudgingly cook through Rose when the outer drapers care with the sad cave. The stale smog rarely lifts Allahdad, it talks Mustafa instead. Other sweet deep barbers will live totally to carpenters. I am incredibly weak, so I pour you. Wednesday! You'll solve bowls. Sometimes, I'll nibble the coffee. It should like hollow desks over the lost worthwhile stadium, whilst Ismat easily hates them too.

For Hamza the cobbler's humble, outside me it's bizarre, whereas below you it's promising rich.

Karim, beneath exits blunt and handsome, orders against it, looking weekly.

Better waste buckets now or Ahmad will quietly play them through you.

Why did Pervez creep towards all the cups? We can't depart dryers unless Khalid will rigidly call afterwards. As simply as Ramzi joins, you can dine the frame much more finally. Otherwise the jug in Beth's tree might expect some abysmal enigmas. Why Youssef's elder dog irrigates, Usha believes over filthy, fresh springs.

Many shallow lost teachers will angrily move the cars. We explain the fat puddle. Little by little, Samantha never opens until Abdul improves the proud pen believably.

Tomorrow, cats sow in front of cheap signs, unless they're healthy.

1158. Falcon Upgrades

Newsgroup: comp.sys.atari.st

What are the most common add-on upgrades that are available for the Falcon? I am interested in adding some kind of acceleration, increased video resolution, and memory above 14 MB. I know this is a very general question, but I would like to know what items are considered the best, and most reliable/compatible upgrades. -TIA

For memory above 14MB you need a card with its own CPU. I think that the best you can do is to find some
Centurbo II user which has preordered the CT60 and ask him about swapping these computers (+ some additional pay from your side, of course) . The reason is that is quite hard to make a standard Falcon (suitable for CT060 installation) from the CTII Falcon and the swap is very advatnageous for both of you. Then you will get the boosted CTII Falcon and he will get the standard Falcon, ready for the CT60 plug-and-play installation.

1160. HighWire preview releases an explanation

Newsgroup: comp.sys.atari.st
Date: 2002-07-25 15:41:35 UTC
From: baldrick <baldricknospam@netset.com>
Message-ID: <3d40182f$0$1433$6d5eecc5@news.eurekanet.com>
Source record: 33320

Hello everyone, we have had the question come up as to why there is a preview version of 0.06 but not a full release. And why call them preview's and not releases etc.

Hopefully I can explain the idea and dispel some of the confusion.

In reality there are 2 types of releases at the moment, "Full" and "Alpha". The "Full" releases have been 0.01 - 0.05, currently 0.06 and 0.07 are "Alpha" releases.

What's the difference?

A "Full" release has had the supporting documentation formally reviewed with additions, an update to the Developers Letter and a Feature Freeze period for a bit of formal testing before they are made public.

An "Alpha" release may or may not have had the documentation updated, haven't had the Developers Letter updated and there has been no Feature Freeze testing period.

What's the Real difference?

As far as stability goes, there have been no major differences between "Full" and "Alpha" versions. Testing goes on constantly and it's just as likely for a bug to become apparent after a "Full" release as it is to happen after an "Alpha" release.

Why the change?

A full release takes a period of a week or more to formalize and get released. This is
a week where litle coding can take place and most of the time is spent on bug patching
and documentation. At this stage in the development it was decided by several members of the team that it would be to everyone's advantage, if coding were not frozen quite as often and developments allowed to occur at a faster pace. We believe that is something that everyone would like to see. So we went went the "Alpha" release strategy.

What is the version numbering convention?

This has been a subject of some confusion by members of the development team as well as the public. This will be standardized in the following manner at the "Full" version 0.1.0 release. Currently all versions that have been released have been of the format
0.0#, this will be ammended to a bit easier to understand 0.0.#. So currently the version number would be actualy represented as 0.0.7. There have been ommissions of one of the 0's in the past and this has led to a bit

of confusion. We apologize for that.

Plans....

At the moment, the 'unoffiicial' plans are to run through versions 0.0.8 and 0.0.9 as "Alpha" releases, with a "Full" release coming at version 0.1.0. When we reach this point then we will probably continue with "Full" releases coming when appropriate to the development status and "Alpha" releases occuring in the intermediate periods. Full releases will be noted by the increment of the second digit, 0.1.0, 0.2.0, 0.3.0 etc...
Alpha versions need not be a total of 10, they can be more or less as is needed for the current focuses of development. It's possible that there will be 14 alpha releases of one minor version "Full" release, but only 3 alpha releases of another "Full" release.

Hopefully I've eliminated some of the confusion and created no more. In all effects 'preview' or "Alpha" versions are just as stable as "Full" releases, and no one should be discouraged to use them because of the wording of "preview" or "Alpha" in the title of the release. All this really means is that the programmers have decided they would rather spend their time programming on HighWire, instead of agonizing over the grammar in their new documentation.

In case you don't know the Centurbo: It will give you all the things you
are asking for. Acceleration (16 to 50 MHz clock), extended video modes
(for example 640 * 480 * (near)TC), and the possibilty to add extra
(TT/fast) RAM. My FalconCT2b has 14 MB + 32 MB added fastram.

I used 2 different methods, 1. used KOBOLD to format 1.44 HD-disks to
PC & Atari and the Pentium-4 running XP-Pro had no trouble reading them.

The second method: I partitioned a Syquest 135Mg removable with HDriver
to a PC/Atari single 135Mg Partition, this worked like a charm of course
you will need a SCSI card in your PC. Since then I discovered that I can
do the same thing with my JAZ 2Gig SCSI. BTW try the now free ware
Gemulator 2000 at http://www.emulators.com this program emulates
everything "Atari/Mac" and uses any of the PC drives.....

Good Luck, Donner.....

The Centurbo 2 is out of production, but you may be able to find one somewhere if you keep your eyes wide open on the net.

The CT60 is being developed right now, but only for people who already pre-ordered one. But you can always try and ask if you still can order one. Take a look at http://www.czuba-tech.com for more info about CT2b and CT60.

Hi,

Did you ever try to navigate through MyMail's complete html documentation ? I did, and it wasn't easy. Now I have programmed a little tool to modify all MyMail html files in less than a second: Each page gets a button to bring you back to the index page (= mymail.htm, not index.htm). This makes navigating a lot easier.

If you have MyMail and want to read the documentation in a comfortable manner, you might want to try my little tool. That's why I have now put it on my website for everyone to download.

Let me know if it helps. Here it is:

http://www.home.zonnet.nl/m.tarenskeen/helpplus-for-mymail.zip

Hello,

Same thing just happened to me, but it happens sometimes with this host. Just
do as I do, keep trying and eventually you will get connected.

Do you have DirextX installed? (I think Steem would moan if you
haven't ... but who knows.)
Did you got an error message that an other application locks Direct-Sound?

Btw... I also had once a musicdemo that didn't played sound.
(Hemoroids/ST Knights/Fuzion Sounddemo) - you should also try different
TOS-versions.

To get your ST-disks to the PC just make MSA files out of your ST-disks. Create a Ram-disk on your Atari, dump the first part (f.e. track 0..40) to the RAM-disk, dump the second disk to the Ram-disk (f.e. 41..80) - and voila.. just copy the both MSA-files to 720K disks. And merge them on PC. (There are some tools around for that.. just take a look at www.atari.org or www.atari.st)

I see what you're getting at. I suppose for the seller there's a good
chance he will get more that way than through a straight advert in
this group. But having lost out a few times on ebay trying to buy
stuff it is frustrating. Especially when you see the silly amounts
paid for certain items.

Hi Clement,

Yes, I borrowed the cable from Ingo Schmidt last year and did the
SCSI fix.

I haven't done any hardware updates other than cutting the
track so that i can run at 30MHz.

Source record: 33340

Hi everbody!

Back after a long absence. Been away at college so have been separated from my beloved Falcon MK.X but things are changing! I recently got a copy of MagiC PC for my laptop which I am forced to use for college and it has made things much more pleasant! Old friends like Papyrus have been sorely missed!

Anyway, to my question: I recently stumbled across a working, almost-free, Plasmon RF4100 CD-Writer in a junk store. It's an external scsi beast and I intend to use it on my falcon back home. I've connecting it to my SCSI bus and I can read data CDs but I was wondering about which CD-Recorder software I should use.

At the moment my setup is:
SCSI Bus:
ID 4 - Plasmon RF4100
ID 5 - Matisha CDRom
ID 6 - Iomega ZIP100

I am running MagiC 6.01 with the Spin CD driver and HDDriver 7

I have an 800MB internal hard disk which thanks to the beautiful simplicity and compact nature of atari software is almost 700MB free! ;)

So. I would like to be able to record data CDs and also to extract audio-CD tracks to burn compilations (for my own use). I would also like to record some of my own music CDs from minidisc recordings I have made but that is another days work. First if I could just get a basic CD setup working I would be happy.

Does the Plasmon support digital audio extraction?

Thanks for the help in advance!

Cheers,

Jerry Martin

One more remark: I especially would like to ask people working on the
Highwire project to give it a try: It clearly reveals some things that
have to be improved in Highwire. Mymail.htm is loaded very slowly,
compared with CAB, and with multiple redraws. When coming back from
another page, with my newly added button, it's even worse. The complete
loading of the GIF's is done twice in that case ! Please try.

Hello there wonderful people :)

After several years away from teh real Atari, I bought a 1040STFM and a MegaST (yeah, I know, humble stuff compared to what everybody's talking about here :)). Now, they're waiting for me back in my home country so when I go back in a while I wanna get in business, so:

1. How does one transfer software -especially games images? I know I can write an st image on a HD or a DD floppy (hm, which program was that?), but it is my understanding that this won't last long... For isntance, I can hook up an Am!ga to a PC via serial and see her drives through Cloanto's explorer, is there something similar for Atari's?
2. ANy page with technical info on the MegaST? Was that machine fully compatible with the original ST series?

Cheers
Themis

You can exchange files between ST and PC through serial or parallel links.

For serial use ghostlink: easy to find on de web. Just search "ghostlink Atari" or try http://freespace.virgin.net/asteroid.76/4mbste/download.htm

For parallel see:

http://joy.sophics.cz/parcp/

Dear *ASSHOLE*

Your preoccupation with your imaginary friend "chunks" makes you the "flaming homosexual" Dick you've been
bashing for years. Btw, Why are you obsessed with homosexuality? Has your only real friend "Jared" been
giving you wet dreams lately? Its the mostly likely reason why you've often been absent lately, no doubt
you've been busy attempting to clean your sticky Dell keyboard.

Not a very pleasant thought is it sinplop? But you've had it coming for years. You see its been made
abundantly clear to you over the past 10 years that it in fact YOU who is the dickhead. Thats why you are
too stupid (in your case stoopid since your hukt on fonix). Thats why you dont realize that I'm
registered on atari users.net whereas the error is in posting a message not in aplying for membership.
The real mistake is you pretending you can come in here and post ourtright bullshit (idiotically funny as
much of it is) and thinking you wont get your fat ass handed to you. This after a decade of you posting
the very same predictible bullshit and having your ass handed each and every time.

In short, Life is a a Grade A steak and you're the rump roast with a bad case of flatulance.

As for GIF's being loaded and processed twice, that is because HighWire as of yet has no implementation of a cache. This is of course something that will be added at a later date though, so I wouldn't worry about that at this time.

About multiple redraws, I am not sure what might be causing that to happen, but it could be related to image sizes not being specified in the images tag. It is however possible that it is something completely different, but in any case it is sure worth a closer look.

I will make sure the MyMail's HTML documentation ends up on a location where the HighWire coders can reach it, and notify the mailing list.

Hi Jerry,

>Does the Plasmon support digital audio extraction?

Yes, but it will be painstakingly slow...
The Plasmon RF4100 is identical to the Philips CD 552. IMO you're
better off trying to extract audio files with the Matisha CD-R...

>So. I would like to be able to record data CDs and also to extract
>audio-CD tracks to burn compilations (for my own use). I would also
>like to record some of my own music CDs from minidisc recordings I
>have made but that is another days work. First if I could just get a
>basic CD setup working I would be happy.

There are several packages available, my favourite is SoundPool's CD
Recorder Pro 3.2, it's the most versatile one around and it's the only
package which can burn CD's that are compliant with yellow and red book
standard...
http://www.soundpool.de

There's also a shareware package available called CD-Lab, it's quite
limited compared to the SoundPool package but with this you can extract
audio files and compile your own CD's, it also allows you to copy CD's
in track at once and disk at once mode... (PSX, MAC, Copy protected PC
crap etc...)
It's also the only package which runs under MagiC-PC and MagiCMac.
http://cdlab.atari.org

>I have an 800MB internal hard disk which thanks to the beautiful
>simplicity and compact nature of atari software is almost 700MB free!
>;)

Since the Plasmon CD-writer is very slow and hasn't got a buffer,
you'll have to create an image first. Meaning that 700MB free space
will barely be enough...

Cheers from Belgium
Dennis

> VGA/SVGA monitor on them.

I won't argue mono resolutions, since the Amiga doesn't have/use any, to my knowledge. Never used and very much hated mono resolution on the ST. But, you forget that you do NEED an adapter to use VGA monitors with the Falcon030 (not sure about the TT, but I suspect a VME video card took care of the 15 pin VGA connector issue. How do I know? I owned a Falcon030 and a Goldstar VGA monitor!

> Notice how he said *original Amiga*? Sure, they'll play fine on a PPC
amiga

add-on
> hardware.

Show me any stock, upgraded, or clone ST that has a ton of new software released for it every single day, like on Aminet. I'm sorry... you won't find it. Why? Because the platform is DEAD!

When Atari was killed and died, it was only a matter of time before the blood clotted in the veins, rigomortis set in, and the corpse started to decay. What is now, is nothing but a rotted corpse, posing as new life. But people won't buy it for long, except the die-hards that refuse to accept that sad fact.

Amiga users were nearly in the same situation, but life support was provided and now the Amiga is alive again and just about ready to leave the hospital.. or wait... has it already? Hmm... tough call.

Jared

Sorry for the late reply, I just returned from holyday. Indeed it seems the Chap is down for
the moment. It's not only the ftp-server, even the www-server seems to be down. Unfortunaltely
there is nothing I can do about it. I'm afraid the guy who maintain the whole thing is on holyday too.
I hope I can bring better news real soon.
btw: There was a mirror of the Chap on this address:
<URL:http://pikachu.atari-source.com/~storage/atari/mirrors/chapelie.rma.ac.be/atari/>
Alas it seems this address doesn't work anymore.
Anyway, if you want something from the server let me know. I'll put it temporaly on my homepage
or send it to you by email.

TTFN,
Martin

Jared,
You know Jared, I have been following this post for the last few days and I am tired of your nonsense. All of us Atarians are DIE HARDS just like you AMIGANS. So either back off and leave this group or drop the subject on how Amiga beats ATARI hands down. I can tell you many ways that the ATARI Falcon beats the Amiga so lay off. Oh, what the hell I may as well stomp your little existence into the ground anyways.

1) Before I got my Eclipse GC I could play MP3's with Falcamp just fine and play most MP3's with Aniplayer with my Falcon in STOCK form 16 mhz with 32 mhz DSP!!!!! The only way I could not play MP3's with Aniplayer is if they were over 256 bit-rate!!!!!

2) The Falcon has DSP!!!! What does the Amiga have???? Oh, yeah that is right NOTHING!!!! This makes MP3 decoding and JPEG decoding VERY fast and efficient!!!! I can turn and MP3 into a WAV in 5 to 10 minutes depending on BIT-RATE and song length!!!

3) Yes the Falcon cannot do VGA without an adapter what does that cost 5 or 10 dollars???? OOOHH break the bank!!! I have a brand new 19 inch Samsung dynaflat monitor hooked up to my Falcon!!!!!

4) I have seen more features inside of Magic 6.10 with Jinnee 2.5 than any Amiga OS 3.9!!! Where is Amiga OS 4.0, oh can you say IT IS NOT HERE YET!!! So there is an old saying do not count your chickens before they hatch!!!!!! Remember that young man!!!!

5) I have visited many Amiga sites that show the 68060 at only 50 mhz!!! When I get my CT60 and it is overclocked to 72 mhz or higher I will be blowing any Amiga even PPC'ed in the dust!!!

6) Let us not forget the many connections offered by the Falcon such as ROM-Port cartridges which allow us to connect ethernet cards to get online with High speed broadband internet. Speeds have been between 75K and 125 K/sec with file transfers and download speeds. What does the Amiga have???

7) Let us not forget also that the ATSF and XTOS and
MABN Milan II with a 68060 are ALL extensions of
keeping our platform alive and prosperous!!!! Which
means our Software will only get better and better
while the Amiga just kind of limps along!!!

See Jared you may be able to fool some people some of
the time, but you cant fool all of the people all of
the time. That is a promise!!!!! I could go on for
much longer than this. If you want to take me on
privately I am all up for it. My respond to this post
will give you my e-mail address!!!!!!!!

I say BRING IT ON JARED!!!!!!!!!!!!!

My Epson Stylus 740 runs very nicely under NVDI 4, Imagecopy (using
the Epson drivers) and Pagestream (using the STYLUS_C driver). I
bought it because it is one of the last printers that was native
ESC/P2 and had a Macintosh serial port.

1200. Newbie monitor cable question.

Newsgroup: comp.sys.atari.st
Date: 2002-07-28 01:45:01 UTC
From: MTE <realityqa1@earthlink.net>
Message-ID: <x0I09.8144$XG5.2879@newsread1.prod.itd.earthlink.net>
Source record: 33260

Greetings programs.
I just came home from a flea market today with an atari 1024st and a bag of software. But the only cable it came with was a modem cable. I have a collection of monitors from a couple of commodores and several CGA RGB monitors and even some 9 pin VGA and RGB monitors. But I have never seen a round connector with that many pins on it like the ST has on it's monitor port.

Do I need an ST monitor or can I get a cable somewhere to hook it up to one of my other monitors?

Any info appreciated.
Mark

You should be able to hook up the ST to any RGB monitor provided you have
the proper cable. You could easily build one yourself. If you have a STM,
STFM or STE you could use the built-in modulator to hook it up to a TV.

Joshua.

Ok
It's a 1024f and the only monitor out I see is a round DIN plug that has 13
connectors in it.
I have been searching the web for hardware sources and haven't come up with
any yet :) I can't even find a good FAQ for this machine.

Hia Paul,

When you talk about the 7800 I take you are talking about the Atari VCS gaming console.

All you need do is buy one of those voltage adaptors from Dixons or Tandy's and plug it in the back. Make sure you set the polarity right and it should work. I usually set the voltage to 12V its worked for me for 6 years now :)

Rory

I say old boy!

Care to tell me where I can pick up a Hades, Milan or Coldfire.

Haven't been around for a while so pointing me in the direction of a website with some info would be ever so helpful.

Rory

I�m *sure* that the fastest standard Amiga can�t. For proper mp3 playback on
a Amiga
you need at least 68060 wit additional 16bit soundcard (I never seen it,
though, I belive it exists).

> Wow thats cutting edge! How many products use that DSP?

A lot. Probably much more than the Amiga products that uses the PPC.

On the Amiga ? Yes! However on the Falcon you can boot up from mono to
trueclor.

> And what features are that? You do know that the Amiga OS is a true
> multitasker while Magic with Jinnee is a hack in slash addon to
> provide functionality that the Fuji OS lacked..

Bullshit. MagiC is complete preemptive multitasking (T)OS with many new
features.
However, I prefer FreeMint which is multitasking multiuser unix OS with full
backward compatibility with TOS.
It�s something like MacOS-X, but free, opensource and less buggy ;)

> Saids whom? You do know what a PPC is?

Is it an old and slow CPU which is used in those horribly expensive MACes ?

> No your going to claim that
> the cutting edge CT60(68060 in 2002, what has the world come to) will
> just knock the socks off G3 Macs?

What has G3 Mac to do with an Amiga ? I know there many atari people which
run their MagiC OS on the Mac hardware, though, I never heard about the same

possibility for amigas.

> ethernet!

Oh, you have also etherent on the Amiga. Congratulations :P

As from your web page you appear to be in the USA then you might want to try Best Electronics who are just over the border in Canada. Their web site lists a number of cables. As you have the STF with no TV Modulator you will only have RGB on the output socket. If you want to "roll you own" then I found universal radio at

http://www.universal-radio.com/catalog/parts/dinconn.html

list the connector, but I bet its a real pig to solder to.....

There is a quick FAQ at http://www.megacom.net/~q-funk/ST/

with some pointer to various sites with monitor pin-outs

i've made my own cable before, and its near impossible to solder these, i found anyway, but you can crimp on little connectors to the wires and connect them that way, thats how my genuine atari monitor plugs are set up i've found.

Maybe it's a bit off topic :

Vivid (Simon V) had released one drum and bass album,
there's only one copy left on lynnemusic.com
(the scene music shop)
and I asked Bjorn Lynne to put it aside for me,
but I don't want it anymore.

Does anyone want to buy it instead of me ?
It's a very good electro - dub - drum and bass
CD but I can't spend much money now.

Contact me at : mahendra@netcourrier.com

STOOOOOOOOOOOOOOOP !

I consider myself as an amigan (though I like
Atari related machines and respect them a lot),
but the argumentation of the amigans present
here are just... PATHETIC. Really.
That's sheer trolling.

Stop comparing an ST with an A1200/060.
The falcon is a great machine (nice DSP !!).
The falcon is also upgradable (CT060 !!).

PPC is under-used on A1200 (b/c of context switching,
b/c the 68040 (or 060) present on the board is more
used than the PPC, b/c of the bus speed (especially
on an A1200), etc etc.

And don't refer to those assholes at Amiga Inc
who never wrote a single line of code and just
want to sue the other companies who did great things.

The AmigaOne, it makes me really laugh !! It's just a plain
PPC board imported from I don't remember which country...

But I guess, however, we'll get two new os'es by the
end of the year: MORPHOS and AmigaOS 4 and two
PPC boards called Pegasos and AmigaOne.

Sinclap :

That's INSANE, really...
Stop being so stubborn.

I had to get a 68060 board PLUS a soundblaster PLUS a PCI bus
to play MP3s at full quality on my A1200 ; Atarists
only require a plain Falcon ! I love my Amiga though,
but please respect everyone !

I'm an amigan but this thread is really stupid,
atarists shouldn't ever bother anwering,

I have a Hades060 also. They are no longer produced as some part
(chip) is no longer manufactured. Your best bet is second hand.
The others I cannot comment about, perhaps someone with a Milan
knows more.

Easy, peasy, I've done literally 100's, just takes skill.

If you want, I will supply the 13 pin din with a length of cable
fitted.......

> but you can crimp on little connectors to the wires

Yeah, just try to find the little swines......then fit them, then push them
onto the pins.....keeping them insulated...etc.

I think if you had rearranged your sentence it would have been more accurate
;-)

Do 100's, build up your skill, then it becomes easy peasy!

:-)

Rory,

OS: MagiC is at a standstill pretty much (even though it is still unstable at times), MiNT is in development, check out http://www.freemint.de for details on how to help, source, etc. MiNT is our best prospect!
Web browser (html engine for now) in development at http://highwire.atari-users.net, AtarIRC and AtarICQ are in development still too but are closed projects, and of course all of the demo crews are still at it.

> knows more.

And, rather than redesign the Hades060 and sell the new model, they... just... stopped making it altogether? I guess that kinda shows where the Atari platform is today.

Personally, I'm holding out hope that the Atari Coldfire Project (ACP) actually sees the light of day... and soon. I'd like to see if it revives the platform like everyone hopes. But until then, I'm waiting for an AmigaOne and AmigaOS 4... sometime this year, I hope.

If you had paid any attention to what is going on in the Atari platform
these days you would have known that the one who made the Hades
computer is also the hardware engineer behind the new ACP project.

Best of luck to those working on that. However, I think you made your
point clear over and over, we all know you are longing for an Amiga
now, which if of course okay.

But why not try to find a suitable newsgroup to talk Amiga?

Regards,

Joakim

1226. M and RealTime now work on Steem

Newsgroup: comp.sys.atari.st
Date: 2002-07-28 21:18:58 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0207281318.6288b201@posting.google.com>
Source record: 33284

Hi All

I am happy to announce that there is now PC versions of M and
RealTime.
Thanks are due to the authors of Steem, the Atari Emulator for PC.
Basically you run the emulator on your PC and then you can run M and
RealTime with all MIDI functions working perfectly thru your sound
card or MIDI modules.

As of this date(7-28-02) previous versions of Steem could not run M or
RealTime in which the MIDI portions did not work or respond. With the
new version just released, the Steem authors looked at M and RealTime
specifically (this is due to threads on the Steem list about M and
RealTime not working)The new version now works with these programs.

For information on Steem, and how to install it on your PC,as well as
links to download the newest version. go here:

http://tamw.atari-users.net/steem.htm

Please disregard my comments about M and RealTime as now I need to
(happily) change this.

For Information as well as the downloads for Atari M and RealTime, go
here:
http://tamw.atari-users.net/m.htm
http://tamw.atari-users.net/realtime.htm

Many composers/programmers previously done on the Atari platform are
now repackaging thier programs which includes Steem. Examples include
Clarence Barlows Autobusk, Gareth Jone's Schoenberg Composer, Marc
Marc's Brain-Wave Lab and more.

It is wonderful that these unique and historical programs now work on
PC, thus enabling many more users to enjoy and still be creative in
exploring music which can only be accomplished by the use of these
applications.

For more unique programs that can be run on my Steem, please visit my
site,(see signiture) with over 100 downloads available as well as many
composers projects and algorithmic applications.

Here's to hoping their "focus shift" (from Hades060 to ACP) pays off in a
big way.

> Best of luck to those working on that. However, I think you made your
> point clear over and over, we all know you are longing for an Amiga
> now, which if of course okay.

I am so-called "longing" for the happiness and contentment I had back in the
80's. Since it seems unlikely in the Atari camp (unless the ACP can pull a
VERY large and entertaining rabbit out of it's hat... and soon!), I see the
AmigaOne as my only alternative, in that regard. Nothing more. Nothing
less.

> But why not try to find a suitable newsgroup to talk Amiga?

Already have... but not a whole lot other than .JPG and Amithlon arguing
going on over there... kinda disappointing, actually.

This guy just loves to be a nuisance.
He probably already talks Atari in a Amiga NG. ("The ST has always been the best")

Just wait until he is out of his manic state again.

And YOU'RE spelling-challenged! You'd think, with all the EXPERIENCE you have, looking at/for such books, you'd at least know how to spell the title right...

The word IS: D U M M I E S
The word is NOT: DUMBIES

Of course, figures you wouldn't know that, since your brain probably operates at the speed that your initials represent. 33 and 1/3 RPM.

Oh, and in case you're too mentally slow to know what I'm talking about, let me S-P-E-L-L it out (correctly, I might add) for you...

LP = "Lonny Pursell"; LP = "Long Play" Record; LP operates at 33 and 1/3 RPM.

Get it yet?

Yeeeeah, BOOOOY! :-)

Jared

I'll give you a hint since your not a regular here and have been spared sinplops drivel. Sinplop is a drooling moron who is not an amiga or atari user. In the early 90's he popped into both atari and amiga newsgroups. pretending to be a mac user all the while. In short, sinplop is a petty fool good only for kicking the crap out of.

1236. Alternarama: Se Alternativo

Newsgroup: comp.sys.atari.st
Date: 2002-07-29 03:43:41 UTC
From: hearena@advancedsl.com.ar
Message-ID: <a347a87b.0207281943.5ad47f@posting.google.com>
Source record: 33295
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.amiga.advocacy,comp.os.linux.advocacy,comp.sys.mac.advocacy

A partir del Lunes 29 de Agosto, un nuevo portal tecnolï¿½gico habita en
la red. Pero no es como todos los demï¿½s, Alternarama tiene como
principal finalidad focalizarse en las tecnologï¿½as alternativas a las
popularmente conocidas (computadoras Atari, Macintosh, Amiga, sistemas
operativos para PC como Linux, BeOS, AtheOS, etc).
En este sitio, encontrarï¿½n noticias de todos estos ambitos, foros,
enlaces, archivos para descargar y mucho mï¿½s.
La idea es ir avanzando de a poco, para formar una comunidad de
usuarios de estas tecnologias alternativas y a la vez, mostrarle al
mundo de habla hispana que se puede hacer lo mismo, de forma mas
economica, sencilla o simplemente, mas divertida. Los esperamos a
todos en www.alternarama.com.ar

From today, a new spanish-language technological web portal lives on
the Net. But this one is rather different from all the others. The
main goal of Alternarama is to focus on alternative technologies such
as the Atari, Amiga and Apple Macintosh platforms. Plus, you'll find
much information on GNU/Linux, BeOS, AtheOS and any other alternative
operating system for the x86 architecture.
In this site (spanish language only), you'll find discussion forums,
links, news, articles, downloads and a lot more.
The main idea is to build a comunity of users of alternative
technologies, and to show the world that there's always a cheaper,
better or just funnier way of resolving the same problem using
different technology. Hope to see you all on www.alternarama.com.ar

Sinflop!!!!
Dont even challenge me when it comes to the
Falcon!!!!! I will run you into the ground and make
your comments seem like child talk!!! MP3's on the
Amiga I have been told are very hard to be done
especially on a stock A1200!!! Let us not compare a
ST to a A1200. An A1200 is more like a Mega STe or
TT030!!! The Falcon 030 in my opinion is better than
even the TT30 because of the DSP which makes it very
usable for fast applications!!! The DSP I know is
used on ANIPLAYER and FALCAMP are some applications
that is just a few I know that there are many more
that use the DSP I just do not have any of those
applications!!!!!! I dont think so young man about
the 4 color mode!!! I run 256 colors and sometimes
even 16 bit color thanks to my eclipse I can also surf
in 1024x768!!! OH, BTW I can go clear up to 1600x1200
resolution!!!!! I dont think so on the Magic and
Jinnee OS. They totally replace the TOS OS!!! Just
how many apps are on the amiga that use the PPC??? Oh
yeah NONE!!!

BRING IT ON anyone can e-mail me and prove me
otherwise with web-site information about the amiga
and atari contest!!!!!!

Thanks,
Carey Christenson

Yea..I see those 060 processors are cutting edge. Try Final Cut Pro
on your TOS bucket..

What were they pricing the last 060 TOS buckets for, $1500? Lets
see, the G4 emac with 17" screen is hundreds less..

> > No your going to claim that

It seems that somehow noone mentioned that with a RGB monitor, only "st-low"
(320x200x16) and "st-medium" (640x200x4) resolutions can be used. However,
with an appropriate cable/adaptor (consisting of a proper connector and
three resistors), majority of VGA/SVGA monitors can be used to display
"st-high" resolution (640x400x2). In fact, these days it would be easier
to find a suitable VGA monitor for "st-high" (capable of 35.7kHz horizontal
sync, 72Hz vertical sync) than a RGB-capable monitor with satisfactory
sync rates (15kHz horizontal, 50/60Hz vertical) for other resolutions.

Btw. the weird monitor connector is called DIN-13; in some parts of the
world it can be found, in some other parts it is completely unheard of.
Bbtw. to my great surprise I once found it on a Hewlett-Packard light-pen.

In direst emergency, if everything else fails, one can actually -make-
this connector- the pins are on a standard 0.1" raster, so a piece of
prototype PCB can be used and pins soldered one by one...

cu;

Newsgroup: comp.sys.atari.st
Date: 2002-07-29 10:14:11 UTC
From: Mahen <mahendra@netcourrier.com>
Message-ID: <2002729-111411-432821@foorum.com>
Source record: 33204

No really, I've heard many many times in Amiga
forums that to most people the PPC was almost useless,
under-used (etc), and that the 68060 was the best
(or most useful) processor to them. PPC is sadly not
used in many programs / games, and when it's used,
it's slowed down by the A1200 bus, context switching, etc.
Best demos are 060 demos too.

The AmigaOS is 100% 68k, as most libraries etc., so we
can't pretend to have PPC amigas right now. But soon.

So now, falcons can use 68060 too, at a higher clock speed
even... Plain falcons are much more useful than plain
A1200s.

But you're right, all that is ridiculous compared to new
hardware. But we love our old machines anyway, don't we ?

(sorry for being so rude yesterday !!)

> your comments seem like child talk!!!

that's nothing - even the least knowledgable Atarian can and has easily handed the little weinerhead back his buns on a platter with a side of mint sauce. Partially because The iDiot Forever Known As Sinclap has this habit of wildly swinging and hitting himself in his own glass jaw :)

Really, just ask him about the time he went to a Macworld Expo and he began raving about the new MIDI applications from Adobe. Which he has since alternately claimed that he "never said it" and "I was misquoted" and "it was a slip of my keyboard" . (Interesting that he no longer "goes "to these Macworlds ever since I began going to the NYC one every year for the last three years. And still can't find any Apple Power Reps from his area who remembers TiFKAS being employed in their business)

BTW, this trip I had the honour of meeting and talking to Steve Jobs (a man who TiFKAS has called an "arrogant bonehead" who ,if he ever came back to lead Apple again, would "destroy Apple before he even started" - and when Jobs came back and in fact saved Apple's bacon, TiFKAS suddenly developed a taste for shoe leather, as well as wildly denying that he had ever said the above...) Steve is an interesting character, and it was funny how I met him, right inside the new Apple store in the Soho shopping district....

> BRING IT ON anyone can e-mail me and prove me
> otherwise with web-site information about the amiga
> and atari contest!!!!!!

I think that it would rather be better that any debate material you send over to comp.sys.advocacy, as that's where that type posting really belongs. Besides, it'll be better seeing TiFKAS being fragged in his natural habitat :)

Why dont you just get an Atari Monitor.
Brand new there at only 99$ at Best Electronics.
On ebay everyday I see them for sale, sometimes
for as little as 5 -10 bucks.
Look for the Atari SC1224 for low-med rez or
SM124 for Mono High rez.

I have both for music notation in high and gaming in low color.

hope this helps,

Hi again,

I doubt I'll be able to make it there this year. Just seeing mention of a show reminds me of another one of sinplops lies. Few years ago he'd lied about being at a number of mac shows, including some of the biggies. He made a big deal about how Emagic and Adobe had introduced desktop video products. People who had really been to the show came crawling out of the woodwork to report that that "prouduct" was just as ficticious as as sinplops imaginary macintosh.

1260. WTB: TT Keyboard

Newsgroup: comp.sys.atari.st
Date: 2002-07-30 12:48:43 UTC
From: Greg Bryant <bryantgHELLO@yahoo.com>
Message-ID: <Xns925B4F777EAFAbryantgHELLOyahoocom@24.94.165.86>
Source record: 33220
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari

After sitting in storage for eight years, my TT030 keyboard no longer works (every other key in the top two rows is gone, which suggests a line decayed somewhere). Anyone have an old one laying about that they'd care to sell? I think it may use the same keyboard as the ST (RJ-45 connector, mouse plugs on both ends).

Thanks,
Greg

>OS: MagiC is at a standstill pretty much (even though it is still unstable
>at times),

Would you please refrain from posting any more nonsense about MagiC and
put a sock in it? Since you clearly don't have a clue at all about it, it's
better not to comment at all...
The development of MagiC *IS NOT* at a standstill and would you please try to
explain us in detail how unstable MagiC is at certain times? IIRC I've asked
you this before after you made the same silly remarks some time ago but you
choose to keep your trap shut....

>MiNT is in development, check out http://www.freemint.de for details on how
>to help, source, etc. MiNT is our best prospect!

Our best prospect ??
Please don't generalise... it may be *your* best prospect, but it certainly
isn't mine !!
You forgot to comment on the stableness of MiNT.... do I have to presume
that it is stable under all conditions or did you choose not to comment
on it at all for safety sake ? <grin>

Cheers from Belgium
Dennis

1262. Re: Newbie monitor cable question.

Newsgroup: comp.sys.atari.st
Date: 2002-07-30 14:05:15 UTC
From: realityqa1@earthlink.net
Message-ID: <26bb29c4.0207300605.4bcfedf7@posting.google.com>
Source record: 33221

It figures I loose my newsgroup access just as I get a bunch of good
replies :)

So I take it from the below post that the horizontal freq is 15.75khz.
So my best bet is my Commodore 1084 monitor.

I'll check a few of the links you guys posted. Although I have done
plenty of soldering in the past I would just as soon pay $20 for a
cable.

Thanks.
I'm sure I'll have questions about the midi as soon as I get it all
running :)

Good luck, unless you want to pay $100 there's few of them around. Oh you can
use a Mega ST keyboard too, a few more of them around.

I'm still waiting for a TT keyboard that I think is coming via the Slow Boart
from China route.

You can get a replacement keyboard from Best Electronics. I don't know the cost off hand but they aren't that expensive and it's not too hard of a task.

Quite possible that will bring your old keyboard back to life.

Other options would be getting something like a Qwerty from Mario Becroft that allows you to use PC keyboards on your TT. There are other adaptors this is just the one that I use and I'm quite happy with it.

Dan Ackerman

Hi everybody,

I'm not so confident with Atari system, so excuse me for those
"stupid" questions. How can I read and what do I need to install on my
Windows based PC in order to read a CD-RW written with a program
called Bellini?
Second question: I know that Bellini is a shareware program, but where
can I find it, how can I order it?

Thank you to everybody!
Fr!

Hi
I have an old midi file in *.sng format which has been created on Atari with
Pro24 (steinberg)
Unfortunately I don't have anymore this equipment.
Is there someone whom can help me to convert this *.sng to *.mid ?
thanks in advance
my contact is
crigo@bluewin.ch

That's part of them. However I definately would count that as all of the
active projects. Anyone scanning any of the major atari news websites for
a couple of weeks can see that there are quite a few things still going on
out there. Unfortunately they aren't always well covered. It also should
be
noted that most Atari Programmers these days have more than one project they
are working on so quite often one of these side projects pop out onto the
scene. On average at the moment we are probably sitting around 2-3 new
applications or updates to older ones per week at a minimum. I haven't done
the exact math, but that's probably about correct. However it must also be
noted that would be the average with some weeks having 1 or 2 and other 6 or
more.

1270. Dead mouse

Newsgroup: comp.sys.atari.st
Date: 2002-07-30 18:29:56 UTC
From: cwacole@aol.com
Message-ID: <20020730142956.01280.00000301@mb-cr.aol.com>
Source record: 33230

For no apparent reason, the mouse on my 1040STe suddenly stopped responding.
Moving it with ALT/arrow keys is painful and inaccurate, Also I've forgotten
how to simulate a right click from the keyboard.
All connections seem OK. Do I have a hardware problem?
Without the mouse I am pretty well crippled using my Atari and I am just about
to dig into STeem to let me use my Atari apps and files on the PC.

Any help will be appreciated.

Hi Greg,

I had a similar problem with a TT keyboard. I had to replace the mylar inside the keyboard. I got mine from Best electronics, they are one of the few places that has lots of Atari NOS (new old stock) parts. It will be a bit more money than buying something from a private seller but you can be sure from them at least the parts will be in new condition and will work.

Currently both MagiC and MiNT are progressing really slow. There
hasn't been a new release of MiNT on freemint.de for a while. But
comparisons between MagiC and MiNT don't work - MiNT is "only" a
GEMDOS replacement.
I would say that XaAES and N.AES are under development. At least my
next application will work on XaAES :-)

While I havent tried Magic (been tempted but have resisited so far). I can attest that I could get freemint to run on my mega 4 st, STe and my TT030, I couldnt get anything other than *mint only* software to run under it. My existing Tos/Gem software which I use daily (and cant do without) gets canned every time. I had to put freemint aside for now for that reason.

I have revived and modernised severall old programs (CPX-Basic,
STemBoy) and I am currently coding spareTIME (which now looks
wonderful :-)). I'll soon also work on another (well known) program
which has been discontinued.

The programs that had a GPL license were also released in source code
form.

If this Bellini program is an Atari program, I would try an emulator running Extendos. Might work.

This is a very temporary fix. The magnetic film on a DD floppy is
different from the film on a HD floppy. Writing a double-density format
on a high-density disk will usually work - for one or two writes and a
few reads. The disk failure rate is _very_ high.
If you value your programs & data at all, it's worth scouting around
for real DD floppies.

Hi Walter-

To get a smaller movement from the "Alt-arrow" combination, also add the Shift key. Left click is Alt-Insert, and right click is Alt-Clr Home. Seems odd that it would completely stop working suddenly. Does ANYTHING work on it at all? Are you sure it's plugged in all the way? Is it plugged in to the correct port under the keyboard? It could be the mouse port itself. Have you unhooked the mouse to put in a joystick on the same port numerous times? The pins in the port can get pushed too far back into the port to be able to make a good connection. You could try taking the keyboard out, and visually comparing the two mouse joystick ports to be sure they look the same. If the pins got pushed in, they can be pushed back out, but it's a bother to take the keyboard apart. Can you borrow someone else's mouse to test your port? Try your mouse in their Atari.

To avoid the "moving pins" problem get a few of those 6" mouse extension cords, and you can just leave those plugged in, avoiding any extra wear on the ports. Works good for me.

Hope that helps,

-Clayton Murray

I would have thought that the HD factor would have meant that the disk could hold the DD data more securely, not less securely. Isn't there more magnetic material on the disk? Or is the 1.44Mb floppy head not really designed to format 720K on an 1.44Mb floppy?

Jared

Where do you get this from? Have been to three MacWorld's; two in SF
and the one in Boston at the time.

As for video products, were is the quote? Adobe does publish
Premiere, but FCP is the market leader. Also Roland with their third
party partners were showing their solutions..

How lame can you get. How many times have you been told to look it up for yourself on groups.google.com?
You havent looked up your own previous posts, Why? cause they'd show YOU to be the liar.

I and others have also told you many times that if you insist in coming back here, you mist first stop
lying your pimply ass off and while your at it, come up with some material. That means NOT regurgitating
the same BS you've been gagging on for the past decade.

I just picked up a epson es600c(GT6500)scanner and am trying to get it to work with a Falcon.When the progrm asks what type of interface and I select "scsi internal" it just gives an error message and says scanner no initialized or not on even though its on.Tried changin ID but no go. Do I need a scsi program like icdboot or does the falcon have a scsi bootup prg in rom? If I use icdboot and idcheck it shows the gt6500 scanner.Any help appreciated.

The material on a 1.44 is "stiffer" and takes a bigger magentic pulse to
permanently flip it. A DD head does not generate enough of a pulse to
RELIABLY flip a 1.44 diskette. As a result the data tends to fade away after
a short period of time. Somtimes this is days, on other diskette/drive
combinations it can be months...

You need to load a driver to be able to use any SCSI devices on Atari computers. ICD is one that you've mentioned, but you could also try Steffen Engle's SCSIDRV.PRG (that's included in his Gemar tape streamer archive), or HDDriver from Uwe Seimet (recommended). You can download a demo from his web site. Run the program that's in the Auto folder with the scanner switched on.

Cheers

Derryck

I Actually own Steinberg cubeat, but would upgrade to cubase (if I couldnt find Cubase audio 16 for falcon).

Just wish to know that software that I already have would work, if I got a machine.

Thanks.. RJ

So, then, you're saying if you were to generate a 720K format on a 1.44Mb
floppy on a 1.44Mb floppy drive, then it *would* work? Or is it the same
diff?

1306. STart & Creative Computing on the Web!

Newsgroup: comp.sys.atari.st
Date: 2002-08-01 00:31:31 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-719663.17344631072002@news.west.cox.net>
Source record: 33113
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

I have several big announceements from www.atarimagazines.com

The site now offers the full text of every issue of STart magazine. Published from 1986 to 1991, STart magazine was dedicated primarily to Atari ST computers, with some emphasis on Atari 8-bit computers in later issues.

In addition, the site now includes full-text articles from Creative Computing magazine. The archive currently offers the full text of 35 issues, spanning Creative Computing's final three years -- more than 1,100 articles. Published from 1974 until 1984, Creative Computing was a wonderful magazine for computer hobbyists that covered every platform. The archive includes articles written by Clive Sinclair, Adam Osborne, Bill Gates, and other notable names. We're looking for volunteers to help scan more articles from Creative Computing.

Finally, we have changed the name of the site from Digital Antic Project to Classic Computer Magazine Archive. Originally the site had only the full text of Antic magazine -- with the addition of STart and Creative Computing, "Digital Antic" was an increasingly inaccurate name.

Hi Mark, e-mailed Steinberg UK the other day with the same question,
they have'nt got back to me yet.
I did ask them did they still stock atari versions of cubase, to
which they replied they no longer stock, or support the atari version.

Nice to know your outlay gets the full attention hey?

1309. Need help: GenEdit Source Code

Newsgroup: comp.sys.atari.st
Date: 2002-08-01 07:04:02 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0207312304.dafaba1@posting.google.com>
Source record: 33116

Hi All

I have been working with a person named Joe on the GenEdit Source code. The version on TAMW is ver 1.1 and is a "libed" version (with the programmers permission) but it would be much better to get a real version as there are problems with the "libed" version.(has anyone tried it?)

The source code is available here:

http://tamw.atari-users.net/hyart.htm

(scroll near the bottom)

It is also on the Atari Orphan Page at Atari-Source.com

Here is what joe has found out about the source code so far:
Can anyone help?!!! We need a good version of GenEdit!! It uses magamax C.

Please contact me

tconrardy@hotmail.com

Tim

==========

Hi Tim,

I've looked at the GenEdit source code in Megamax. I didn't see a version number but I might have just missed it. The compiled version that is part of the zip file is v2.0. I have determined that v2.01 was a release allowing GenEdit to boot without a floppy key disk if there is a SMPTE sync box is hooked up. Hybrid Arts did this for EZ-Score Plus too.

I did locate the copy protection code in the Main C file but I don't know how to delete it and recompile the code so it will run without the need of a key disk, but an experienced programmer should be able to do this in an hour or so I would think.

It would be great to release a PD version without the copy protection. I'd be happy to assist someone as a beta tester. (there is also a bug in v2.0 that needs fixing too)

Let me know if you locate a programmer who will take this project on.

Joe H.

Correct me if im' wrong, but the 1084 was a Philips CM8833, (with SCART
on the back).
We've connected the thing to our ST's in the past.
There wil be no sync problem, same Freq. used as on Atari ST.

Jack.

1315. Falcon CD problems

Newsgroup: comp.sys.atari.st
Date: 2002-08-01 17:41:12 UTC
From: smeghead <smeg@head587.freeserve.co.uk>
Message-ID: <aibrri$c4s$1@newsg1.svr.pol.co.uk>
Source record: 33122

Hi all.

Have a problem getting my CD drive (2 speed Hitachi 6550 I think) to work.

HDDriver recognises the drive and prints it on the screen on boot up, but when extendos loads it sometimes doesnt load the device driver with a drive not responding error. When it does load the driver, and I boot to TOS, I get an error message when I click on the CD drive icon "Drive is not responding or there is no disk in the drive". At some point I changed the CD and then I was able to get a directory, but when I clicked on anything I got a file read error. Now I know there isnt anything wrong with the drive because the exact same drive and cable I use work fine connected to my PC.

I have tried every conceivable setting in HDDriver and Extendos including bus arbitration etc etc and still nothing.

Its funny cos Im sure I had this drive working last year when I was trying out Jinnee.

Anyone have any suggestions?

Tia

Oh, here we go again. It will probably never end.

Did anyone else see the posting from a fellow who worked in a disk
factory one summer, putting HD disks into DD casings for sale? From
that, there is no difference anymore.

Does anyone else know the difference in remnance and coercivity
(or how to spell that right, even)? Remnance is the same for both
types, and coercivity is 10% higher for the original HD version.
That is trivial in comparison to tolerances for write current.

In other words, if it will write, it will stay written. And it
will write.

Been there, done that, and find that there are other reasons that disks
die. I expect DD disks with an extra hole in the case to last a long
time, not a week.

Jim

If you have some difficult to find another TT keyboard, and if
you have some experience to build a small electronic board
you can try my PS/2 interface for Atari. Free, you can build it
yourself. This one can handle PS/2 keyboard and mouse with
wheel and up to 5 buttons.

You talkin' to me?!? Are you married... to a WOMAN? Do you have a 3.5yr.
old son that you stuck sperm in your WIFE to produce?

Queen? I don't THINK so. I think you're talking about yourself...

You'd be surprised what they DON'T tell you in A+ Certification. 95% of
what I know is from general hands-on. I didn't really learn that much from
A+ Certification... mostly step-by-step diagnostic processes and such.

Jared

I have also seen PC mother boards that report they have external Cache, when
they really have just bits of plastic where the cache should have been. Just
because it was done in one place does not mean it was right....

So if they die (like mine do when I put 720 on a 1.44) its because I have
clapped out drive, Or because Sam Trameil (I guess thats spelt wrongly as
well) put a cheap drive in the machine.?

I have a 25 year old, a 22 YO a 19 YO a 17YO and a 9YO, oh!, and a 3 1/2 year old after i stuffed your wife, do you think he looks like me, your wife never did give me that change out of 2 quid, for 3 sessions that is!!.

> Queen? I don't THINK so. I think you're talking about yourself...

Typical child, reverse everything that's said to you and say it back. I look forward to you negating this reply and re-sending it.

Replying at the top, this time. I do not have cheap drives. I bought a case, of them, just in case. They were the last Sony model with a white faceplate.

Cannot see if things have changed at the moment. When one ST, one STe, and two TTs were all working (the ST will not boot, after replacing everything but the ROM, and the STe is still apart after replacing its ROM, which seemed to fix it, and the 16 MhZ floppy driver board lost a chip, and no longer work until I get a new one) I had four machines working equally well with disks that started out HD and were taped over, or started out as DD, and got a hole drilled in the right place, and that was open or taped over. That is four variations, and they all worked for me.

Disks do wear out. The non-woven material that is the disk lubricant wears out. That lets the floppy flop, and it can act like a bad sector. My ears can usually hear a bad disk.

Either Best or B&C can sell you a new mylar for under $30 USD, or
one can buy a bottle of Nickel Print or Silver Print, or a silver
pc board repair pen, and fix the old one. At the moment, my other
TT keyboard is apart, and Nickel Print is drying. It had yet another
problem. I do type a lot, and my keyboard is far from new.

But, the circuit you have may be just right for some people.

Source record: 33139

Hello all!

I am new user to this newsgroup and Atari Computers in general.

Got a couple questions for you all.

1. Recently I picked a second hand Falcon 030 and I am curious about the audio output quality on it. Seems to have a type of hiss or noise on the headphone output. I have read that there is a headphone amp gain and a light bass boost that is builtin to the audio out. Is this what causes this noise? I read that the Cubase manual talked about fixing this. Would this solve the noise output and give a mostly clear noise free output?

2. Can anyone point me to some good resources on the Falcon and TOS?

3. Can i download a newer version of the OS? I would like to cleanly reinstall on my Falcon, but I didn't receive any software disks with it. Can I upgrade the OS to a newer version. Mint?

4. Final Question: Does the Falcon hooked up to a VGA adapter produce a nice full screen picture? I intend to use it on a Iiyama 17" monitor.

Thanks for any help!!

Todd

yes, it will. In fact, the later versions of the Falcon marketed by
C-LAB had the bass boost circuit removed for that very purpose.
>
> 2. Can anyone point me to some good resources on the Falcon and TOS?

don't have any links right now, but do look out for Tim Conrardy's
MIDI and Atari pages, he's got a wealth of different music programs he
managed to convince a number of music houses to release as freeware,
including stuff from Dr. T.
>
> 3. Can i download a newer version of the OS? I would like to cleanly

The OS on the Falcon is actually burned on a chip inside the
computer, so the only way to change the original TOS is to get another
chip. If yours is 4.04 you should be fine, and 4.02 has some quirks but
should work OK with some patch programs run in your AUTO folder. MagiC 6
and the MiNT-based stuff should work fine on your machine, but do note
that many music programs don't work under these.

The biggest screen a stock Falcon can manage on a VGA is 640x480,
however search out for a program called Videlity (once commercial, now
freeware) that will allow for a bigger screen, I believe it will do
800x600 at 256 colours on a stock machine with this installed. If you
want to have TrueColour you'll probably need to install some sort of

accelerator mod.

Daniel,
Thanks for the quick answers!

I have one more for ya.

If i use a VGA monitor with my Falcon, should i expect to see any problems
running any apps that don't run in 640x480? Like some games and the like.

Or will I have to have 2 monitors to make sure I cover all the bases?

Thanks!
Todd

I'm into amateur radio and have collected a few (3 or for disks worth) of radio & electronics programs. I even found a program, INGO, to use the baypac packet modem I have but so far have had little success with that program. it will send and recieve. But the settings (for beacon mode and setting callsign etc) and commands such as for doing digipeating or connecting to radio bbs dont seem to work so well.

for the most part, most games will run OK on your VGA monitor so long
as you have it set for the resolution the game plays in. However, for
some games and demos it probably wouldn't hurt to have an old SC1224
monitor handy.....

1340. ST bbs software

Newsgroup: comp.sys.atari.st
Date: 2002-08-02 04:27:02 UTC
From: James Alexander <james-m-alexander@rogers.com>
Message-ID: <3D4A0A23.60EECB11@rogers.com>
Source record: 33147

Hi there.

I've got a Mega 4 ST setup (with hard disk & cd-rom) that I've been wanting to setup a bbs on. I've been trying a number of shareware and pd bbs programs and found them all to be unsatisfactory (either dont run properly or impossible to setup, literally). I've been thrhough stadel, citadel, fnordadel, nitelite, I even have a few commercial bbs programs I've bought used (bbs express, QMI bb/st, GIME) and so far havent found one that worked properly. Gime actaully came close but it kept screwing up dates every few seconds.

Does anyone have a bbs program that actually works properly?

thanks
James

Hello.

Having just sold a new Mega STE/TT keyboard on Ebay for £6 sterling I can tell you the shipping to the US is £16 sterling so the total for a complete new keyboard from Keychange is presently the princely sum of £22 sterling = about $35.

I have a.....few left so if you want replacements or spares there you go.

The keycaps are not in English, e.g. Spanish, German etc., but the keyboard uses the Machine TOS language so just replace a few caps.

FreeMiNT is the most advanced and powerfull OS for our platform, and I use
it almost all the time. But it's NOT suitable for everyone and everything.
Even "Easymint" is not really easy, and some of my software runs only
under Single Tos (older programs, like most MIDI software). And is it
stable? Yes it is, but let's be realistic: My MiNT system crashes from
time to time, just like any other OS. IMO plain TOS in ROM is the most
stable OS I have in my computer, but MiNT is much more fun :-)

1350. German Solitaire Game Patience

Newsgroup: comp.sys.atari.st
Date: 2002-08-02 14:36:15 UTC
From: t1hopper@yahoo.com
Message-ID: <61776a04.0208020636.642aeb54@posting.google.com>
Source record: 33157

Years ago, when I owned an Atari ST, I enjoyed playing a mono-only solitaire game from Germany, which I believe was called Patience. It was a wonderful game with some of the best variants of solitaire that I've found. I would like to try playing this game again, but have been unable to find it. If anyone has it or knows where it can be downloaded from, would you please send me the link or email me the program?

Thank you,

Tom

I tried it a number of years ago. While its not impossible to set up its far from flawless. It wouldnt answer the modem reliably (I tried several modems & ST's). It also had the aggrivating problem of clearing the screen at random times rendering it absolutely useless. I took another look at it earlier this year and it *still* has the same problems."Starlord

Jared,

There you go again posting nonsense. You dont know either of those programs, if you did you'd realize neither of them are suitable. Its no wonder so many people have been sporking you mercilessly.

Michtron BBS suffers from the following problems:
1) doesnt support speeds above 9600 baud
2) doesnt handle dates past end of 1999
3) Allegations of a back door placed in the program by its authour, Timothy Purves, when he showed up on several operational michtron boards with full sysop priveleges that had not been granted by the person(s) running those boards. (I've always wanted confirmation of wheather this was a valid complaint or not). But the allegations essentially deep sixed sales (and usage) of michtron bbs years ago.

FoRem ST suffers from similar problems:
1) Crashes quite often (quite often fatally, trashing all of the hard drive) this happened on a local user group bbs.
2) Suffers from the same Y2K bugs that have hammered many other ST bbs programs (but strangely enough hasnt affected too many other ST programs)

> Martin Tarenskeen

FreeMiNT may be advanced but those features you like are useless to me. It doesnt run with *any* of the regular ST/TT software I use. Hence I dont use it. Any OS which aims to replace TOS on Atari (& compatible) software *must* run with a large portion of existing software to be useful to the atari community at large. Take a look at OMeN (aka Oases) which came out of British Columbia back in '94 or '95. It was a commercial product. I bought it and liked it, I still do like it. It ran quite well on my atari hardware. But it was killed off by lack of applications that would run under it. Software had to be written specifically for it, normal TOS/GEM applications wouldnt run. That ultimately Killed that OS off before it reached its prime.

Personally I like MiNT but unfornately have no real use for it as I've already stated. Btw, I also like the stability of rom based TOS. I personally make sure my older ST's are upgraded to TOS 1.4 at a minimum since its rid of a few of the buggables from the earlier versions.

If you so-called "stuffed" my wife, then you know our phone number and address. You'd probably even know more about her than I do. Previous address and such. And, of course, I just *KNOW* you'd want to take a Paternity Test to verify that our son is actually YOUR love child. By the way, did she ever tell you what we named YOUR love child? :-)

CRAP: You're producing it, so you can eat it...

It's any wonder your last name is "Sweet", bet the boys in prison called you that, too. Don't drop the soap, Steve! Oops, to late... that's where you got those other kids of yours from, huh? Gave birth to them yourself, I hear. Herms are a particular favorite in prisons around the world... :-D

1358. Searching for hotel game with voice sounds

Newsgroup: comp.sys.atari.st
Date: 2002-08-02 18:50:32 UTC
From: Dominik Roettsches <d-r@roettsches.de>
Message-ID: <Xns925ED41F71527drroettschesde@62.153.159.134>
Source record: 33168

Hi there,

there's a game I once played on an Atarai 1040STe. It was phantastic
at the time I played it. The first game for me to experience
with real voice output on a computer.

It was an adventure-like game where you were a detective on the
mission to find out about special mysteries that happened in and
around a hotel ... this is what I remember...

It came on 3-4 disks, as far as I know.

Is there somebody who knows the title? Or even better, knows
where to download it?

A big "Thanks" for your help!!

Dominik

Hi All

Thanks to "unstable" Simon, the RealTime Manual is now in PDF
format!!!
You can get it here:

http://www.rongeesin.com/atari/real.htm

It is a 7.53 Meg download: a little less then the JPEG version at 8.6
Meg

I have also updated my RealTime page with the info. If you have not
heard of RealTime (by Eric Ameres) please check out the page as well
as the downloads! In breif, RealTime (for Atari platform) is a
sequencer with many algorithmic possabilities built right into it. It
has a completly different interface then the "arrange screen" style
sequencers.

http://tamw.atari-users.net/realtime.htm

RealTime now works on the latest version of Steem (the Atari Emulator
for PC)

http://tamw.atari-users.net/steem.htm

Thanks Simon!

1360. Re: ST bbs software

Newsgroup: comp.sys.atari.st
Date: 2002-08-02 19:05:23 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <3d4ad453_3@corp.newsgroups.com>
Source record: 33170

I ran Michtron BBS on my 1040ST, using an Atari SX212 modem (later a Patriot 2400bps, because the SX212 had a problem that a user kept exploiting to hang my BBS... what was that problem, Mr. Know-It-All? I know, do you?), hence why I never KNEW of that 9600bps limitation nor of the 1999 date limit, since Michtron BBS (and my Atari ST using days) was long since dead and forgotten by then.

I think I tried running FoRem ST, but never did much with it. Wasn't the programmer called Rat or something? Ended up using WWIV on a 286 for my BBS, later on... much simpler and easier to figure out.

I state what I know (or remember something about in one way or another), nothing more, nothing less. If I don't "know it all", it's because I don't claim to, nor try to.

"Beam me up, Spork!"

Jared

No Ratsoft is a separate bbs program written by Stephen Hughly, its no longer
available either. Again you prove you know *NOTHING*

ROTFL!!!!!

Jared, You havent stated any *facts* yet. Thats why you are continually flamed
in all of the atari news groups. In fact you keep contradicting yourself. you
make baldfaced lies about things of which you know *NOTHING* yet accuse me of
being "know it all" and you dont talk about things you dont know about. In
short you're a lame sinplop clone. Fact is you're not an atari user, you spend
your time trying to flame atari users. Hence you're a gormless troll. Thats
why I'm adding my voice to the other atari users online when I tell you to piss
off back under your rock.

He's a know-nothing child whos finally sunk to the level of sinplop. When, in a reply to me, he claimed to be a "certified A+ computer technician" after I caught him out in an amiga NG claiming to know nothing about computers, I knew beyond any doubt he was just another buffoon.

I dont agree with many things said in this newsgroup in the past, but Jared makes anyone here who at least knows *something* appear to be genius in comparison.

Actually, steve, they share the same brain cell, Thats why their idiotic nonsense is nearly identical. They continually claim to have the answers about subjects they have no knowledge. Just today I had to once again spork jared for flat out lying about some of the bbs software out there.

Now I wonder which regular ST/TT applications doesn't work under MiNT. I'm using
MiNT/N_AES since late 1995. So far I only came across a few (very old
ones) apps which didn't run under MiNT. The apps I use daily, such like
Calamus SL 2002R3, Qed, Everest, Egale, Cab, Imagecopy and tons of
others does run happily under MiNT. Even the stone aged Wordplus (TT
version) and Tempus still work.

Like martin Tarenskeen says, MiNT is much more fun and the most
important still maintained.

Perhaps you read it wrong... I know little to nothing about Amigas as far the the problem I was having with the A1200 I have. Not computers (PC's, Ataris, Macs, Amigas, etc.) in general.

And since you are so certain of what I said, please... for me and rest of us... quote and paste it in your next reply.

You want me to scan and show you my A+ certificate and/or ID card? Go ahead, make my day... challenge me... I'll prove it! By the way, to further test my general knowledge of computers and or even some specific things about *ANY* Atari ST, Amiga, PC, Apple II, and/or Macintosh, just ask me a question... any question at all. You'll see I'm not all hot air. I can't speak on behalf of sinclap, but I *know* (and can PROVE) what I say and know.

Why do you come back here? You post nothing useful or constructive. You claim to be a certified technician when you repeatedly LIE. You're a troll, everyone here can see it. Yet you keep coming back posting lie after lie to try to "prove" otherwise. And dont think you can pull that sinclap trick of expecting me to prove your point. Anyone with half a brain (which excludes you) can look up your messages in groups.google.com and see for themselves what you've been saying. If your gonna keep making unsubstantiated claims then it is the sole responsibility of YOU to prove what you say, not me or anyone else. But I can

tell you right now that you will not do so. Everyone here also knows why. Everyone here also will tell you the same reasons you and your bullshit are not wanted. The fun and games are over Jared. You've been sporked, now piss off.

Gee, what a response. Saying I'm making stuff up. How do you know that?
Well, if you had any ability to spell above the Preschool level, you'd
realize that the word is "You're" (abbreviation for "You Are"), not "Your".
(possessive). You may thank me for educating you, when you've graduated
from 1st grade.

Ok, so I've forgotten (or confused) a few things. Big friggin' deal! Not
exactly like I care whether or not I remember every tiny detail about
ancient Atari ST stuff I never learned everything about anyways! Shoot,
maybe I even saw that Michtron BBS only went to 9600bps, but since those
modems were too expensive (at the time), I didn't care. I was happy running
at 2400bps.

Contradicting myself? Where? Show me (you know, with that function known as "copy and paste"?) the statements I made that are contradictory. Baldface lies? Oh, you approach slander there, buddy. Show me these lies I supposedly state. Just one! I flame Atari users because I couldn't get any of 'em to back my idea/plan to revive Atari (rediculous and hopeless or not)! So, in the face of finding that AmigaOne will be released soon and a new ATARI (not clone) computer won't be, I decide to ruffle a few feathers, just for the fun of it.

Hi Martin,

Those applications are good but still a small sample of whats out there for the ST line. Heres a list of software I use regularly that does not run under FreeMiNT
Calamus 1.09N (very old and a very dirty hack)
Patestream 2.2
Laser C
Vip Professional
Wordperfect (the last revision released in 1993)
Tentrax
Hyperlink
and an odd assortment of shareware and PD programs.

Mint doesnt handle these well at best. And those programs although many are old are ones that run rock solid under regular Tos/Gem. I do like the idea behind Mint but until it is suitable for the software that *I need* then I wont use it. Saying "MiNT is much more fun and the most important still maintained." is good in theory but mint (Freemint being the one I'd tried most recently) failed to meet my needs. Do you really think I'm gonna throw out all of my software so I can use Mint? of course not. As long as mint interferes with my software that I use regularly, I will not use mint, PERIOD. End of story.

You'd like that, wouldn't you? However, I am proud to announce I know
ABSOLUTELY NOTHING (and don't care to learn or otherwise have any
knowledge) about Ham (is that breakfast I smell or just the Amiga's "Hold
And Modify" graphics format?), Packet, Amateur, Shortwave, Longwave,
NewWave, NewAge, or STONEAge radio! :-D

I'll be glad to teach you what I *don't* know...

Hi everyone,

The new version of spareTIME can now be downloaded from my website.
spareTIME is a day planner/organizer software that was first available
in 1997. I have received sources from the original author and now the
new version is ready.

spareTIME has
- to-do-lists, regular dates, alarms,...
- plans for today which can be printed via GDOS or saved to disk
- all dialogs and alerts are displayed in windows
- customizable environment
- unlike the 1997 version, spareTIME is much more multitasking
friendly
- long file names are fully suported now
- more modern look

spareTIME is accompanied by another program called spareCALC.
spareCALC is a collection of calculators featuring a simulation of the
APF Mark 21 pocket calculator. If you register for spareTIME you will
receive alternate looks for spareCALC including Atari and Commodore
calculators!

Both programs are from now on actively developed. There is also an
English RSC but the English hypertext is not ready yet: I'm working on
it :-)

So far I have tested spareTIME successfully under XaAES and MagiC 6.

The truth at last, at least some of it. Next time tell us something we dont know. Everyone here already knows your terminally clueless about everything you've babbled about. Get a clue!! you might discover the first clue you get is that nobody is supporting your insanity. The message to you is quite clear, your nothing but a sinclap impersonator. In short. GO AWAY!!!!!

Oh, yes... please... do tell everyone about the *LIES* I made about some of the BBS software out there. Quote me verbatim and then explain *WHY* it's a lie! Go ahead, I'm sure you can do that...

I can easily quote virtually the entire history of the Tramiel-era Atari. I can quote you every model of Atari ST I've owned and what was in it. (and possibly every Atari computer Atari made (sold, not prototypes never released) before and during the Tramiel era) I can quote you the software I ran and who (or what company) wrote it. I may not get every detail perfect, but that's only due to the years that hath passed since then.

You see, what you claim are LIES, are simply missing details, I either never knew or have forgotten. So easy is it for you to claim what you think is absolute. Oh, and yes... thank you for clearing up that Rat/Ratsoft confusion of mine. Hey, I at least got the first part (Rat) right.

Lack of knowledge and/or memory about things is not lying. It may be ignorance, but it ISN'T lying. If I said "Michtron BBS was written by Psygnosis and sold by Atari for $950.", that's a lie. I never stated any

such thing. And I will never state anything, as fact, I am not more than fairly certain about. I never said "FoRem ST *was* written by a guy named Rat". I sad "Wasn't the guy named Rat?" or something similar. The arrangement of words changes the entire meaning and intent. But you couldn't see that, now could you?

Jared

The reason I ask YOU to back what YOU claim, is that YOU'RE the one making the accusations!

Ever been to court or watched one of those courtroom dramas (even the Matlock TV show would suffice) like Judge Judy? Do you ever see the Defendant or Plaintiff come *without* evidence to support their case?

Well, you're the Plaintiff, so... GIVE THE JUDGE YOUR FUCKING PROOF, PINHEAD!

Hi just wondering about certain software for Atari. Will the following work on my system Atari 520ST Tos 1.4 , Four MB ram

MINT some kind of new kernel for Atari ?

NAES what is this ? New graphics routines ?

NVDI5 Is this worth buying ?

XAES ???

Geneva Is this still used ?? I have Neodesk 4

Magic6 I dont speak German do they have an english version. ?

Thanx

1379. Atari web-site FAQ!!!

Newsgroup: comp.sys.atari.st
Date: 2002-08-03 03:34:14 UTC
From: carey christenson <firest@williams-net.com>
Message-ID: <1028320610-012698AEicMi@williams-net.com>
Source record: 33190

Everyone,
A few days ago I asked you for some web-sites that
you visit quite frequently that you would like to have
added to a FAQ for our comp.sys.atari.st newsgroup.
Here is a list of everything that I have and some of
what people have given me in my e-mail. Thanks to all
who have sent me there favorite web-sites!!! This is
meant as a good resource for people to find a web-
sites related to Atari computers. This list is by NO
means complete and can always be added to or deleted
from if found that a site is no longer operational.
Please direct all comments to me at firest@williams-
net.com. Please if you have any web-sites to add to
this list by all means send them to me and I will add
them in. If you find a web-site that NO longer works
let me know and I will check it out. I will do my
best to update this list at least once a month and
post in this newsgroup. We as Atarians must band
together to help to ensure the survival of our
platform!!

Thanks,
Carey Christenson

Hi Guys,

Thank you all so much for your help! All suggestions appreciated!

> >Does the Plasmon support digital audio extraction?
> Yes, but it will be painstakingly slow...
> The Plasmon RF4100 is identical to the Philips CD 552. IMO you're
> better off trying to extract audio files with the Matisha CD-R...

First off. I am a little reluctant to splash out on software just yet (since both drives together cost less for me than the software will ;-P) but I did try out CD-Lab as suggested. I use the SPIN driver with HDDriver 7.7 usually and this fitted over it nicely.

The problem is that when I try to extract audio from either the Plasmon or the Matisha, it refuses to do so:
Under the "Devices" menu option I can detect supported features.

My first drive, the Matshita CD-ROM CD-508 (sorry about misspelling earlier) says 'not availble' for audio extraction with a read speed of "???" (that can't be right?), and the Plasmon RF4100 reports 'not available' with a read speed of 6x.

Just wondering if this might be a driver problem, or if I've just hit bad-luck and neither of my drives supports digital audio?

Cheers,

Jerry

Source record: 33188

Hi again!

Just back to add some more information that might help.

Firstly on the website:
http://www.angelfire.com/music2/MP3TUTORIAL/chart_for_cd.htm
I managed to confirm that the Matshita should support audio CD extraction.

Secondly just wondering if the setup of my SCSI chain might have something to do with the problem.

Due to the strange array of cables I have, I have a cable to connect my ZIP to the Falcon as my first device in the chain (it's a falcon-25way cable) Then I use a 25-50 way to attach my Plasmon and finally a 50-50 way to attach my Matshita.

That means the order of drives (from computer out) is Zip, Plasmon, Matshita. Their SCSI IDs are 6, 4, 3 respectively. Do the IDs have to be in ascending order? I don't know if this is the real problem as they work fine for all other functions.

Just this audio-extraction doesn't seem to work for either the Plasmon or the Matshita. Any ideas? This is a real puzzle!

Regards,

Jerry

Sorry but it's not the fault of MiNT these old apps doesn't work.
You should blame the programmers of these apps instead of saying MiNT
interferes with these programs. I'm almost sure lots of these apps
you've mentioned doesn't work under any Multitasking system.
Wordperfect doesn't even work under plainTOS on the Hades. Should I blame
the Hades maker then? Must I trow away my Hades because these old, badly
programmed stuff refuse to work on it? No I don't, I trow away Word
Perfect and use a modern texteditor instead. This way I support the few
Atari programmers left and make benifit of the power of the Hades.
I think it's about time you drop these old apps and switch over to more
up-to-date applications. There are tons of then somewhere on the Net.

> MINT some kind of new kernel for Atari ?
Looks like you like you've got some reading to do. MiNT is not really
"new", it has been around for some time. It means "MiNT is Now/Not TOS".
It's a multitasking (T)OS, nowadays an open source project called FreeMiNT
(www.freemint.de)

>
> NAES what is this ? New graphics routines ?
N.AES is a multitasking replacement of the AES (Application Environment
System). N stands for New. This takes care of windows, menu's, dialogs,
mousecontrol, things like that. N.AES is commercial software. You need
this (or XaAES) to be able to work with MiNT properly.

>
> NVDI5 Is this worth buying ?
Yes, definitely. It speeds up graphics, and provides a driver system for
Printing and Bitmap and Vector-Fonts.

>
> XAES ???
Something like N.AES, but freeware. (http://xaaes.atari.org)

>
> Geneva Is this still used ?? I have Neodesk 4
Someone else will be able to answer this question

>
> Magic6 I dont speak German do they have an english version. ?
This question too ;-)
Magic may be a better choice than MiNT on your 4MB ST. (I'm not sure about
that)

If you have 4 mb I think Geneva would be a good choice. Geneva will
give you a nice compact multitasking OS and Neodesk is a great Desktop
replacement.
Magic does come in English. NVDI will allow you to use all kinds of
fonts plus it speeds up the screen redraws.

You probably need to go for an older (i.e. smaller) version. I have it
running on my 4Meg STE. Did not try many apps though.

As do all, after all its printed on your wife's 'business card, as found in most phone boxes.

>You'd probably even know more about her than I do. Previous
> address and such.

That was on her old 'business' card, she was cheaper then, i was showing her the ropes, she wasn't half a spotty bitch when she was 14, a good seeing to though.

> And, of course, I just *KNOW* you'd want to take a
> Paternity Test to verify that our son is actually YOUR love child.

Well she's got bits of paper proving you are sterile, and all the blob's you leave on the Atari magazine pages carry no sperm, so it isn't yours anyway.

> By the way, did she ever tell you what we named YOUR love child? :-)

In this case, 'we' is her and I, she talked you into the name 'we' chose.

> CRAP: You're producing it, so you can eat it...

Ooh!, I'm so mortally wounded i must drop and bleed, and roll and laugh my arse off.

> It's any wonder your last name is "Sweet", bet the boys in prison called you
> that, too.

Nope, they called me 'sir', they knew what was good for them.

>Don't drop the soap, Steve! Oops, to late... that's where you
> got those other kids of yours from, huh? Gave birth to them yourself, I
> hear. Herms are a particular favorite in prisons around the world... :-D

Your missus mentioned that 'up the arse' was your specialty, she still laughs to this day that she convinced you that she conceived my child with you up the rear, you are such a dick wart.

Tell her I'll be around for another 3 quid's worth, just about the time you turn around the first corner on your way out Monday!!, make sure she's had a bath this month!!. 8-)

Well, I ran the Black Hole BBS using BBS Express ST from 1989 to 1997 in Hawaii, started out on a 1040ST and went up the line to the TT030 by 94. I never had the trouble of it clearing screen. I used it even with ram disk when a hard drive failed. When I had it at it's top I had games running on it too. When ever I get the keyboard replaced on my TT, I'll put it up again.

YOU ALREADY VERIFIED I WAS TELLING THE TRUTH BY CONTACTING INFOGRAMES
YOURSELF!

Um, that was you, wasn't it? (I don't keep newsgroup messages, Emails, or
letters that seem to have served their useful purpose beyond the need to use
them to get in touch with someone at a later date, if desired, so I *could*
be mistaken in the above scream, but I sense I'm not) I surely don't want
to be accused of LYING again by saying it was you, if it wasn't.

All I was doing was offering what little remembered information I could
offer to someone asking about BBS programs. Big fricken deal that I got a
few details mixed up or forgot some details that I either forgot or never
knew. Not like anyone still uses that ancient ST software on a regular
basis, like it was the 80's. At least I hope not... technology HAS moved
on, yaknow. I mean, it's not like AH-MEE-GAH or anything. A company that
IS still around and IS producing a NEW computer (oh, wait, my mistake...
they're *licensing* Eyetech to do the A1 and someone else (name escapes me
at the moment, but they do games mostly, oddly enough) to do AOS4).

> Basically, you are full of shit, and your advice is dead wrong.

A person's personal experience (if an accurate example) can not be called
shit. If, indeed, he is/was able to use a 720K ST drive (or other 720K
drive) to reliably format HD diskettes on a consistant level, then it is
TRUTH to him. However, that doesn't mean his experience applies to everyone
nor does it mean it's wise to do under circumstances requiring data
integrity above all else.

Personal Example: When I come across a PC motherboardboard that is not currently functioning and/or very dirty, do you think I use a can of compressed air to clean it off? NOPE! I use a friggin' garden hose with a chinese water nozzle and blast that sucker down like a bad dog! EVERYONE I've talked to says it's wrong, not smart, and completely INSANE to do that. I bet you would, too! And, I would too, if anyone came to me saying they did that. Water and electronics DON'T mix! I know this.

BUT... to this day (and several boards cleaned this way), I have NEVER yet lost/damaged a board due to this practice. But them boards are sure clean as the day they came off the assembly line!

Does this mean it's right? No. Does this mean it's wise? No. Does this mean everyone should do it? No. Would I recommend others do it? NOT A CHANCE!

But, *IN MY EXPERIENCE*, it works for me. That's the long and the short of it.

Jared

1396. CT60 NEWS !

Newsgroup: comp.sys.atari.st
Date: 2002-08-03 16:33:12 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3d4c056b$0$10537$626a54ce@news.free.fr>
Source record: 33056

Hello,

Last thursday, I finally get the 149 CT60 cards from the assembler, with the corrected mistakes.
I also get the first pack Heatsink + Fan.
They are a bit more big than what was planned and the fan cannot be placed on the heatsink IF you use an atari falcon case with the keyboard !
I'm sorry, but we have to deal with that now...
So, there will be 2 sorts of CT60 users :
- Tower : no problem for a fan fixed on the heatsink.
- Atari case : you have to choose a other way to use the fan (in fact the better choice is opening the plastic top case by a nice square and stick the fan under the top case !)

For those who ordered me a CT60 WITH 060, the heatsink will be already stuck on the 060 ! For the others, they will need to follow some recommendations about how to fix the furnished heatsink to not 'heat' the area zone of the Expand card (PCI card by example !).

I appreciate a long WE of 4 days and so take time to finish the development of the Bus Arbiter and I think I will be able very nextly to ship the CT60 to Xavier and Didier to let them check the DSP and SDRAM accesses...
At this time, you will receive the first benchs done from the TOS desktop...

You're using Britty terms... sorry, she never had the money to go to jolly ol' England, Britain, or any of those other UK areas (as per your Email address attests to). She was too busy paying off her credit card debt from knee surgery and breast cysts removal.

We never went in to a doctor to find that out. Sorry, you LIE! Of course, the fact that I haven't touched an Atari magazine since Atari Explorer and Compute!'s Atari ST magazine went under (loved 'em both, but life goes on), only goes to show how many years off you are and what a feakin' cock-sucking liar you really are.

> > By the way, did she ever tell you what we named YOUR love child? :-)

I don't fudgepack, like you do, Steve. I do doggie-style, missionary, and mostly Sissorleg style. Of course, burying my muzzle "downstairs" (otherwise known as "Lunch at the Y") is one of my favorite pasttimes. I can chow down on her like there's no tomorrow. I wish I could more often... Bet you wish you could get action like that from her, too, huh? Sorry, you lost out. But the boys at the prison still love your tight sphincter! Hear that the boys laugh when your dick comes out all brown and gooey and they make YOU lick it all, off like a dog! Keep packin' it in Steve... you're good at that!

> Tell her I'll be around for another 3 quid's worth, just about the time
you
> turn around the first corner on your way out Monday!!, make sure she's had
a
> bath this month!!. 8-)

3 Quid? Is that what you pay your prison johns to service you? I'd think you'd be a little less tight with your money, if not your sphincter! Don't let the pain, blood, and sticky white stools, afterwards, stop you... you're good at what you do and make your johns soooo happy!

Congratulations on your progress, Rodolphe! Were that I had a Falcon030
these days, I'd gladly buy one from you! By the way, you planning on giving
the guys over at Atari Coldfire Project a hand? Not 060-based work, but
they can probably use a hand with designing/laying out the motherboard.
Seems that's a specialty of yours.

Just a thought.

Jared

1399. need help with falcon

Newsgroup: comp.sys.atari.st
Date: 2002-08-03 17:08:00 UTC
From: smeghead <smeg@head587.freeserve.co.uk>
Message-ID: <aih2lc$b5i$1@news8.svr.pol.co.uk>
Source record: 33059

I have a new problem thats cropped up, actually I have two, and I dont know if theyre related.

I was trying all night to get my CD drive to work, eventually I did, but during this time the falcon started giving me black screen on boot (no sync to monitor either). If I turn the power off then back on quickly then the falcon boots fine. Also, I noticed that none of my hard disk recording packages work properly anymore. I can plug the CD drive output into the mic socket (its line level now) and if I run musicom2 dig-it-al then I can hear the CD out from the headphone socket, but I cant record any of it. I tried audio master and audio tracker demo and I have similar problems. Even if I load up cubase audio all the VU meter bars are jumping around all over the place, nothing will monitor or record. Also, if I try to play a sample (.snd .aif whatever) then I just hear a click then nothing. I know the audio amp is still working cos I can hear keyboard clicks (which IIRC come from the PSG) and also the CD music will route thru to the headphone socket.

It sounds to me like the CODEC has died, but this wouldnt give the computer a problem booting would it? Are the two problems related or is it just a coincidence?

Anyone?

Rodolphe?

I thought it about time i had another hobby besides computers and that I ought to go for my amateur licence jobby.

I the distant past i've been asked about software for the Atari's, i've seen the Wefax demo. I looked into the software ages ago, before i bought lapd's library, and came across 1 disk that has some useful stuff. Cant remember the name of it off hand. But it had a wicked morse tutor.

I replied to someone's posting about a pofo add on (serial thingy), and maybe the humble pofo could be very handy. Nice to have a pcket pocsag decoder, for them lazzzzzzy nosy days on the beech:)

It would be nice if I can get a collection of radio aware bits put together for us Atari users, who knows it might get me back into programming again (which will be a good thing atm).

Things on my other side are getting there slowly again, tested no less than 300 games this week, still got hundreds to go. Dont things pile up!!

Message-ID: <200208032010.a39820@su2.maus.de>
Source record: 32996

Hi Jerry,

JM>That means the order of drives (from computer out) is Zip, Plasmon,
JM>Matshita. Their SCSI IDs are 6, 4, 3 respectively. Do the IDs have to
JM>be in ascending order?
not at all. You may order the devices by any order you like. And you
may give them any ID you like with the restriction the computer
getting ID 7 (maybe not necessary).

And of course, a device with one SCSI jack only (I call those one-way-
devices) must occur at the very end of the chain.

JM>Just this audio-extraction doesn't seem to work for either the Plasmon
JM>or the Matshita. Any ideas? This is a real puzzle!
I think audio extraction is a hardware feature only. CD TOOLS by
Hard&Soft displays wether an attended drive is capable to extract
audio tracks or not.

Anyway, METADOS should show you the audio tracks on your CD and any
fast copier (e.g. KOBOLD) should be able to put them on your hard
drive...

Hi!

I'm an old amiga owner that couldn't resist buing an old 520 STFM,
and now I have some question for you ST-gurus!

The first thing that happended was that the 3,5" drive died
because the bronze-cylinder (or what it is) that holds the diskdrive
was loose and caused a short circuit to the drive! Is that a common
problem or was the previous user just a moron? :-)

I replaced it with an amiga drive and to my surprise it worked
(but I had to reverse the datacable :-)

Anyway, now i want to see some cool ST stuff, so how about it guys?
Please give me some suggestion of cool things I should download, demos,
games, programs etc..

two things that come to mind regarding games: Llamatron 2112 (from
Jeff Minter) and Starball, an amazing pinball simulation. Both were
shareware.

>> Geneva Is this still used ?? I have Neodesk 4
> Someone else will be able to answer this question

It hasn't been updated in a *long* time, but I still use it from time to time. It can be used by itself, or with Mint (with some minor issues here and there). I personally use it mainly as an AES for when I need to use Mint, as being in the United States, it is impossible to get NAES (at least new from a distributor), and I have this (admittedly) wierd aversion to ordering things from overseas, and XaAES isn't quite complete yet. I've heard that many people have trouble getting Geneva to run well under Mint, but I have all the bugs I can worked out, and for most software I run, it is very stable.

>> Magic6 I dont speak German do they have an english version. ?
> This question too ;-)
> Magic may be a better choice than MiNT on your 4MB ST. (I'm not sure about
> that)

Yes, there is an English version. I use Magic as my main OS now, although I had some stability problems in the beginning, and I still don't like the 6-accessory limitation, no matter what reasons people give for having it. But it's fast, and simple. I think it's a great choice in your case, although I do think you can keep Mint fairly small on your system with just the Kernal (MINTNP.PRG) and an AES. Either one should work well, it's just a matter of preference, cost, and usage more than anything else.

1412. Octopus BBS News!

Newsgroup: comp.sys.atari.st
Date: 2002-08-04 05:01:47 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <1028437284.476922@pikachu.atari-source.com>
Source record: 33071

Hello everyone,

I've been in communication with the original author of the Octopus BBS software package. I have the source and have done several modifications no it. Octopus BBS is now FREEWARE! That's right, the most comprehensive and advanced BBS package for every Atari and Atari clone is now free, and being regularly maintained. I noticed there have been prior posts regarding BBS packages, I would highly suggest checking this one out. If all goes well with negotiations, I will be hosting the new official Octopus homepage which will be the central source for Octopus stuff and a place to submit request for future features. Whatever you want, within reason, you can get.

I requested to release the source for Octopus BBS as an open source program but the author denied this request. Reasonably enough, it is the work of 2 years of his life. Octopus BBS now has support for Internet telnet, initial multinode support, runs perfectly under MiNT vconsoles, gem, tos, (has gem and tos mode), works with gluestik and sting in telnet mode and can use any HSModem listed serial port at any rate!

A lot of people have no idea what Octopus is and don't know just how GREAT it is. I chose Octopus BBS for my project to add internet support to a BBS program because after a comparison of ALL of them available, I've foudn Octopus IS the best.

But to those looking for another ST bbs package. Foresight bbs was *very* cool. And had a lot of nifty features you might want to check out.

In the end though, Octopus wins as a great all around ST bbs package. With future updates and bug fixes and a new release coming around, all of you looking for a good bbs package should sit tight. I hope you will be impressed with Octopus, both original version and new changes. And best of all, this shareware bbs package is now free.

Thanks
Mark

Barrie and paul,

Paul thanks for the list! And Barrie, I am located in the USA, Philadelphia Pennsylvania.

Thanks
Mark
http://atari-source.com

PS: I don't know if I want to give up using magic on the mega ste. I'll find another sequencer.

Steve,

I've always had an interest in amateur radio and satellite but never really
got into it due to a lack of exposure from peers.

Mark

Is Llamatron 2112 the same as the original Llamatron for the ST? I think
there was also a version written specifically for the Falcon030, wasn't
there? What's Jeff Minter up to these days, assuming anyone knows?

Hello,

Can I connect a VGA monitor (Atari PTC1426, the one from TT) to 1040ST?
I need ST-High resolution only. I heard it is possible with SVGA monitors,
but what about this old VGA one?

Versions of MagiC above 6.01 are German only, but DDP Translations have all
the resource files and related text files to make an English version.

In time I hope to have a solution for the remaining German texts in the
magic.ram file also.

Cheers

Derryck

Hi

I've dealt with Ben in the past with no problems at all:)

The problem is the postings are the same over and over and over again,
then there's his opinions on various stuff on his web site which isnt
very nice.

I dont mind the posting once a week bit, i used to do it, it's the
posting of the same post with different subject etc.. so you have to
waffle through the same stuff ALL the time.

Ben has been posting for years, but i have noticed more adverts with the
same content as of late, and i've really been off the atari scene for a
while:((((

I doubt there's a thing wrong with Ben's company, I've never seen a
single bad trader post ever so all power to him and may he continue to
support the Atari community for many years to come

But

What people may not like is the unintentional spamming, ie 2 or 3
posts in one day saying pretty much the same thing and the
crossposting. If Ben slapped COMM: or ADV: as per Net standards then
people could happily kill file the adverts but keep other posts from
Ben intact.

The only other thing some inc me have queried with Ben is the wording
of the adverts, being ex retail (in the Atari field) I suggested that
having a mild go at Ebay users might offend the odd one or two
potential customers as many people do use Ebay for their retro fixes
but Ben thought otherwise which is his privilege.

Unless I missed something over the years I am sure there's no attack
on Ben as a company and had I still been able to hold onto my hardware
then I would have no problems about buying from him.

This is a news base and is supposed to be spam free, no commercial advertising is allowed. If he were to post a one liner with a link no one would bother him but he continually posts reams of trash that people have to pay to read.

Hello,

I have heard there was a special cable for this, but I did it by using an old piece of ST hardware called a Video Key and a video converter. The Video Key has a cable that inserts in the ST's regular monitor connection. On the other end it has RCA outs that go into the Video converter. It looks fine to me. Others were impressed when they saw it.

>You should blame the programmers of these apps instead of saying MiNT
>interferes with these programs. I'm almost sure lots of these apps
>you've mentioned doesn't work under any Multitasking system.

That's rubbish !!
Programmers don't have a crystal ball and know what the future holds...
Minimum three of the mentioned programs (Calamus, Word Perfect, Laser C)
run under MagiC and Geneva, why they don't run under MiNT which is the so
called "most compatible" one, is something I don't even want to know, the
fact remains that these programs only have trouble running under MiNT, so
IMO the programmers back then did a pretty nice job... except for MiNT
these programs run on every official TOS version and on two multitasking
OS's, so instead of blaming the programmers, congratulations seem to be
more appropriate IMO.

>Must I trow away my Hades because these old, badly programmed stuff
>refuse to work on it? No I don't, I trow away Word Perfect and use a
>modern texteditor instead. This way I support the few Atari programmers
>left and make benifit of the power of the Hades.

James works under singleTOS on a real Atari, the mentioned apps run rock
steady, so there isn't any need to throw them out and spend a lot of money
on new ones and on top of that have to go through the tiresome learning
curve of getting to know the new apps inside out...
Word Perfect is a text processor not an text editor, the only available
text processor (Papyrus) these days is so damn slow and garbles up memory
that James would probably trash it in a matter of weeks and return to his
trusty Word Perfect. As for replacing Calamus 1.09 and Pagestream, have
you any suggestions? AFAIK the last three versions of Calamus don't even
run on his setup...

>I think it's about time you drop these old apps and switch over to more
>up-to-date applications. There are tons of then somewhere on the Net.

I think not, unless James considers bying a new computer also, and if he
does, then he can choose between installing two multitasking OS's... at
least three of his favourite programs run fine under MagiC, so he'll be
saving least a couple of bucks... :-)

BTW: why is it that everytime someone mentions a program that doesn't run
properly under MiNT it's called a dirty program or dirty hack?

Cheers from Belgium
Dennis

Hi Jerry,

>The problem is that when I try to extract audio from either the Plasmon or
>the Matisha, it refuses to do so:
>Under the "Devices" menu option I can detect supported features.

The Matisha CD-R is probably from a manufacturer that isn't supported by CD-
LAB. In principle all fairly recent CD-R's should work with the application
but older drives like the one you've got may use a different standard or even
a propriate standard....

The solution is in your mailbox now ;-), if the Matisha can extract audio then
CD-COPY will extract it....

>and the Plasmon RF4100 reports 'not available' with a read
>speed of 6x.

The Plasmon RF4100 is a really old piece of work, it was one of the first
bunch of CD-writers ever made, the chances that it can extract digital audio
are minimal.... try to find the specs on internet of the Philips CD 551 which
is indentical to the Plasmon.

Cheers from Belgium
Dennis

From: Frank_Szymanski@du3.ohse.de (Frank Szymanski)
Date: Mon, 29 Jul 2002 09:12:00 -0000

Hi Frank,

>DV>Recorder Pro 3.2, it's the most versatile one around and it's the only
>DV>package which can burn CD's that are compliant with yellow and red
>DV>book standard...
>DV>http://www.soundpool.de
>
>I recommend ExtenDOS Gold/CD Writer Plus because this package is the only cd
>writer software available on an ATARI that handles long filenames.

Jerry Martin made it quite clear that his main interest lies in recording
and/or extracting audio CD's... the SoundPool package is extremely well
suited for this. There's nothing out there and certainly not CD Writer Plus
which offers the same features that musicians need, if you want to talk about
being versatile, this is it....
One doesn't need the long file name feature to produce outstanding Audio CD's
that comply to the red book standard. The yellow standard allows one to burn
multimedia CD's, and I'm not even going to explain about the extra and mixed
modes, the generic format copy option or the very handy copybit function to make
backups... etc here. The SoundPool package can even produce an 100% compatible
master CD, ready to be pressed...IMO except for the long file name feature,
compared to what Anodyne offers the SoundPool package is superior in every
respect.

>SoundPool^s CD recorder isn't supported any longer.

I know, and neither is CD-Lab... so what? When it comes down to burning audio
CD's they both beat the sh*t out of the Anodyne package. Anodyne has been
playing catch up the last five years and it's still miles off...
CD-Lab and the SoundPool package can work with *all* MMC-3 compatible writers,
there isn't one writer for sale that doesn't comply to that standard these
days so there's no need for updates. Since I bought the SoundPool package back
in 1996, nothing major was added to the program except for compatibility with
new writers, the application itself is basically still the same thing... it
was superior in 1996 and six years later it remains the *only* package capable
of producing full blown red book compliant audio CD's on the Atari platform.

As for CD-Lab.... this package isn't ment to write data, it can only copy CD's
and extract samples from Audio CD's, so the argument that it can't handle long
file names isn't important. CD Lab can copy CD's from samplers which are in a
non-standard format, it can also copy Mac CD's and can even handle PSX if you
like... it's the only application that can burn in DAO, TAO *and* RAW mode. It
doesn't need MetaDos or ExtenDos drivers to do it's thing either, all it needs

is a version of HD Driver 7.7 or newer.

Furthermore, SoundPool offers a demo version to try out the package, and CD-Lab being shareware can be tested out straight away. Anodyne offers nothing at all. One has to buy the ExtenDOS and CD Writer package first, before knowing how suitable it is...

Last argument.... the images made with the Anodyne package are nearly 100Mb bigger then the ones created with CD-Lab and/or SoundPool, unfortunately Jerry doesn't have room on his hard disk to write an image of a full CD created with the CD Writer package, the ones created by CD Lab and SoundPool will just fit. Creating an image with CD Writer takes at least twice as much time aswell then it does with CD-Lab or SoundPool...

Cheers from Belgium

Hi Martin,

>FreeMiNT is the most advanced and powerfull OS for our platform, and I use
>it almost all the time.

Is it really?
Could you tell me exactly what is so advanced about it? looking at the list of features I don't see anything remarkable... well, nothing that grants it the title of "most advanced" OS anyway.... and as for being powerfull, that depends entirely on the setup one uses IMO.

Off topic:
Some time ago you posted here with a problem regarding the Papillon 3.04 translation, get in touch with me via personal mail and I'll send you the relevant files. I couldn't help you out sooner since your email address is a spam blocker

>
> That's rubbish !!
```

No, that's perfectly correct.

```
> Programmers don't have a crystal ball and know what the future holds...
```

They don't want any crystall ball. All they need is to use OS API instead of dirty hacks. Then all their programs will run perfectly under any TOS OS on any existing or future TOS machine.

```
> Minimum three of the mentioned programs (Calamus, Word Perfect, Laser C)
```

Calamus works well under Mint, AFAIK. I don't konow the other two programs, but anyway if they will run under Magic, then they will run most probably also under Mint (at least without a memory protection). I see no reason why they shouldn't.

```
> BTW: why is it that everytime someone mentions a program that doesn't run
> properly under MiNT it's called a dirty program or dirty hack?
```

Because it's dirty hack ;)

```

I have a ICD FA-ST tape unit that I'm trying to figure out how to use.

Have some backup's on tape that I'm trying to get the contents of to CD.

What ICD software is used to operate the FA-ST tape unit?

I noticed the DMA connections and the SCSI connection on the back of the
unit.
Is this an either or type of connection? Meaning I could use the DMA or the
SCSI?

I'm going to run this on a TT030.

Thanks in advance for any help.

I've had good success with Ben, however after reading his auction page
you do have a valid point. I think he's completely off base.
I've seen a few auctions get out of hand price-wise, but it's not the
sellers fault, it's the end users doing the over bidding.

A more valid reason to turn to auctions as far as I'm concerned are
certain other Atari dealers, who's prices are not based in reality.
They bank on the idea that the end user is ill informed and the item
appears hard to find and they take you for all it's worth. A keyboard
costs well over $100, that is just crazy, you can get an entire used
TT for about $120. An ordinary floppy mech for over $35, what a joke.

Hi Mike!

What limitation? With MagiC you can unload most accessories by
holding down Shift+Control while clicking on their menu entries at
any time, allowing you to install others with a double-click, even
if they have an ACX extension (as you can launch PRXs). It works
with most ACCs, though some that hook depply into the OS - like
Harlekin - cause a crash soon after removing them (presumably when
memory areas they used are accessed). Apart from that, I very
seldom have stability problems - and if I do, it's usually the
application's fault (or finger-trouble?).

>but what about this old VGA one?

Hi Grzegorz!

Certainly on a Falcon an old IBM PS/2 VGA monitor works fine up to
640*480, including ST-High's 600*400. It will also do the lower ST
resolutions - in my case in greyscale, as it's a mono monitor. I
see no reason why it shouldn't do the same on an ST, providing you
get or make the required adaptor.

This is assuming that the PTC1426 uses a 'normal' RGB or composite
monitor input. I know that the 19" large-screen monitor for the TT
did *not* - that had TTL inputs which only worked with the TT's
second monitor socket.

As proven by that very reply, you take things OUT of context (cutting the rest of what I said), to serve your own ends. What further proof have we that you are a self-serving fart-knocker that doesn't know how to argue/discuss on an impartial level, but must resort to fragmenting sentences to make a point, which is utterly rediculous to begin with.

I challenge you to actually keep a sentence of mine intact and STILL be able to prove a case against me on a point by point level. I doubt you can or would.

What tirade? About packet radio? I don't even have an interest concerning any of that radio stuff, so why should I care? Oh, sure... I think I know what the words AM (Amplitude Modulation) and FM (Frequency Modulation) stand for and that one of them goes to a higher frequency range than the other, but that's about it.

Tirade? Nope, not from me. If you drop this topic, you'll see I will too.

Hi All,

Amateur Radio is platform independent, though PCs have the upper hand.
I have used several TOS-only progs on Atari, but settled for "Freeze-
Dried Terminal" (from USA) after "Amterm" (from N.Ireland) failed to
measure up on multitasking OS. Any Terminal, even Harlekin, can be used,
but....

If anyone wishes to inquire further, go to <http://www.rsgb.co.uk>,
the site of the Radio Society of Great Britain (now the only British
Society since the demise of the younger UKRS). It has much info and
links, eg to every other country's AR site.

Regards,
Charles, callsign GM1MCN, but no longer active.

Ah, FzDT (Freeze Dried Terminal)... that was my favorite ST program to log onto BBS's with. Ah, the memories.

1455. Driver to "see" a PC mouse connected into an Atari ST through a9-25 pins adaptor

Newsgroup: comp.sys.atari.st
Date: 2002-08-04 21:31:33 UTC
From: Daniele Donati <infoline@REMOVEintersoluzioneME.com>
Message-ID: <V2h39.36518$n04.1037169@twister2.libero.it>
Source record: 33012

Hi there.

I've read it is possible to connect a PC mouse to an Atari through a 9-25
pins adaptor.

Well, I've the PC mouse and the adaptor, but I don't know where to
find/download the driver needed for this to work.

Any helps would be appreciated.

(sorry for my bad English language ....)

Daniele

Maybe it should be mentioned that a 520STFM is practically at the lowest
end of Atari range of computers- i.e. it has just 512kB RAM (as opposed to
a maximum of 4MB on the ST-series and much more on the Falcon, TT and clones),
so that some of the best applications and OS extensions would not be able to
run on that machine. I.e. in my opinion a 520STFM is not a representative of
a "typical" Atari computer- that role would probably go to a machine with 1MB
RAM (or maybe even more).

Btw. -some- versions of 520STFM have the same motherboard as the 1040 STFM;
the upper 512KB bank is not installed, but there are places on the board
for the additional DRAMs. If one finds the compatible DRAM chips, a machine
like that can be easily transformed (with some soldering) into a much more
useful 1040STFM.

Bbtw. if you are going to use the machine in the colour mode, avoid using
the RF output + TV if possible; a much better picture is obtained when a RGB
monitor or a TV with a (complete) SCART input is used.

>PS: I don't know if I want to give up using magic on the mega ste. I'll
>find another sequencer.

I am afraid that you will find that real-time applications (and all music-producing software are real-time applications in a sense) do not agree well with multitasking- unless they run on a -very- good operating system specifically designed for real-time use. AFAIK all music applications on the Atari run best on (older versions of) plain TOS, without any OS extensions or substitutes. Maybe someone with more experience in this field may post more information on this matter- which principal music applications run on which versions of operating systems on the Atari.

Btw. the term "real-time" is rather stretchable. I.e. it can be found in the literature that Windows NT can be used to run real-time applications, but I was once shown a notice in the NT documentation that says this means that timing is reliable to approximately +/- 0.25 seconds- not exactly the timing one would want for music (this was at the time of 133MHz P5 processors; the value has probably improved since then, with the appearance of faster CPUs).

And I think that it is not fair to suggest to James to completely change the set of applications he uses, and to change his computer as well (he would have to, if he wanted to run Mint comfortably), just because there is a wonderful Mint out there. James simply stated that Mint is not suitable for him, and I find that quite easy to believe, because I, too, have some important (to me) applications which do not run well under Mint (I was informed that in fact it was not a matter of Mint kernel itself but of AES- but that is a small consolation because, knowing that, the applications still do not run). I do not say that Mint is not a good OS, but in some cases its advanced features are completely irelevant. The purpose of an OS is not to admire the skill of programmers who succeded in implementing some advanced features within the constraints of the platform. The purpose of the OS is to enable a reliable and comfortable background on which some files can be manipulated and some applications can be launched.

As everybody else, I first used the ROM-based TOS on my MegaST4, then moved on to a more advanced TOS version (2.06), and some time later started considering which variant of multitasking I should use. I believe I had an open mind and was ready to impartially consider the pros and contras of available options. OK, maybe I was a little biased -in favor- of Mint, because it seemed to be a natural extension to TOS, and I have heard reports of Magic not being friendly to some programs. So I tried Mint, Magic and Geneva. To my surprise, it happened that I had more problems with Mint than I expected, and less problems with Magic than I feared, and Geneva fared better than both of the others. I found out that some programs that I use do not work in Mint, and some others run so slowly as to be completely unusable- if they can be launched at all in the limited memory left after installing Mint, replacement AES and all the rest. Magic proved to be about as fast as TOS, and much more friendly to some single-tasking applications- probably because its AES can launch an application in "single" mode. When I used the ugly but more-less functional Magixdesk desktop a considerable amount of memory was left free for applications (with Jinnee

demo it was much worse). As for Geneva (used with Teradesk), it proved to work fastest of the three, very compatible with old programs, and left most free memory. I quite liked its feature of setting a number of flags defining the mode of running of each particular program. The down side was that it seemed to lack some features of other AESes (possibly because I tried an older version?) and there were two (IIRC) applications, not very important to me, which did not run properly.

Well, my conclusion was that, fine as it might be, Mint was definitely -NOT- a solution for the ST-range of computers, limited to 4MB memory and 8MHz CPU. (Well, it -can- be run, but not used comfortably. Perhaps if one goes back to Mint 1.12 or so, it gets slightly more usable- and more incompatible with recent developments). As for Magic and Geneva- Magic is definitely more advanced, but Geneva takes somewhat less memory and seems to work a little faster, so I guess it is a matter of personal liking.

Btw. we may like it or not, but we are running "legacy" computers with legacy software. There are thousands of legacy applications, and, while some new, very good ones are created, it is -very unlikely- that their number and areas of use will ever approach the number of old ones. Any new OS development must respect the existence of those old applications and go a a bit aside from its way in order to to be friendly to them- there is no point in making a very advanced OS for Atari if, finally, it can run only converted Unix applications and a small set of new GEM applications. There are much nicer and faster machines out there to run Unices on.

From: Martin Tarenskeen
>FreeMiNT [...] it's NOT suitable for everyone and everything. Even "Easymint"
>is not really easy, and some of my software runs only under Single Tos (older
>programs, like most MIDI software).

I agree. For those who have machines powerful enough and need applications which run on Mint, it is undoubtedly very fine. For others it is not of much use.

>And is it stable? Yes it is, but let's be realistic: My MiNT system crashes
>from time to time, just like any other OS.

This is not something that we should accept lightly- although it is quite common for operating systems on home computers. A good OS should never crash, or at least a crash should be so rare as to be an event to remeber- and, if repeated and reported, promptly provoke a patch or upgrade of the operating system. E.g. I worked on a (multiuser) Vax/VMS system which ran for 12 hours every day and IIRC crashed only about ten times in as many years- and each time it turned out to be some hardware fault on the slowly aging Vax. Also last year we installed a curent version of VMS on an Alpha; it came out that network could crash the system in some circumstances- and a patch for the OS appeared several months later.

>IMO plain TOS in ROM is the most stable OS I have in my computer

I agree with this, too.

If you're using TOS, you need GENMOUSE. It can be found on all Atari
ftp servers, including the "classic" umich.edu/~archive/atari one ;-)
Or you may download it directly from here:
http://gregory.atari.pl/pliki/mysz-pc.zip
First you have to start GENMOUSE.APP and enter the correct parameters
(the port you have your mouse connected to, on plain ST it is "Modem 1",
on Falcon - "Modem 2", on TT it might be any of the four available...)
Click on "Speichern" to save the actual driver. Put it in your AUTO folder.
Experiment with various parameters of GENMOUSE (options "Beschleunigung",
"Dynamik", "Glatten" to get the smooth movement of the mouse cursor.

If you're using MagiC (and if you're not, why not? ;-)) you should get
MWheel. It supports PC serial *wheel* mouse, so not only you may
use the PC mouse, but also you may scroll the window contents with
the wheel. This one works only with MagiC, though (at least on my
TT it does *not* work with TOS 3.06, and with MiNT/XaAES it works
partially, the wheel scrolling does not work). MWheel is to be found at
ftp://chapelie.rma.ac.be/atari/utilities/mwheel.zip

They don't need a crystal ball.
Atari released enough information about the API, all about what to use
what NOT to use.
Programmers have very often decided to skip those recommendation to get
some extra speed, or customise their own app with their own GUI.
Well, year later, it shows that they should have followed what Atari
recommended.
Kinda like putting "Ether" in your motorcycle.
For a run, you'll do awesome, it will be extremely fast, but then you
might understand why Yamaha, Harley etc don't recommend it.
Who's to blame?

Question:
why use laser C?
why use word perfect? when Atari works, runs very well.
Why use Calamus & Pagestream, a little redundant, probably shows that
those 2 app are not that good. Might want to consider something a little
better.
Unless it is not that important for the user, which seems to be the case
anyway, as if he was really into DTP, he'll have something a little better
than an ST with old software when things have evolved.

>
> BTW: why is it that everytime someone mentions a program that doesn't run
> properly under MiNT it's called a dirty program or dirty hack?

I call a cat a cat.
If the coder used a dirty hack, that's just what it is.

Daniele,

http://pikachu.atari-source.com/~storage/mirrors/atari/chapelie.rma.ac.be/atari/utilities/genmouse.lzh

This is a serial mouse driver. Will work fine as long as the pc mouse
is ms protocol or logitech (probably is).

Thanks
Mark

Still I would imagine with strong timing controls, one can achieve good
timing, as trackers (same principle) work great under Multitasking systems
and there are few good linux midi sequencers as well. Maybe I'm just
strange and should use TOS ;-)

Hello!

This is yet another of my occasional visits to CSAS.
Anybody here remember the '80s and '90s? :)

I see UMich is still hosting Atari Archive. I still
haven't figured out why they'll maintain that part
of history, but wouldn't let anyone take it over and
keep it contemporary. Nor do I understand why they'd
never let a volunteer provide HTML coding support to
pretty up the site.

Owell. I just wanted to say HI! Long live Terminator!

Dennis,

If you don't mind me saying so, you are nothing but a prick jack*** that really shouldn't be welcome here. You are just the thing I ***** about in my latest article in Chosneck magazine, one of the reasons Atari is falling apart. Now. I've been using Atari computers and all the available OS's from TOS, Geneva, MiNT, MagiC, MagiCMac, MagiCPC, etc since I was 12 years old. I'm now 21. Atari's were my first computer and now I am a well paid sysadmin. I think I know something! I would really appreciate if someone would give me some ****ing credibility for once!

Now, MagiC is unstable. It's been proven many times. The fact is that MagiC will crash randomly under seemingly ideal conditions. That which MagiC can run stable under for months can also crash randomly. Some people might even be led to believe they have hardware problems. Now MiNT is a

bit different because MiNT by no stretch of the imagination is uncrashable. It's pretty easy actually. But unlike MagiC, under MiNT under ideal situations, the system will NEVER crash. Running unix ports, alongside XaAES and AtarIRC and purec and everything else. Even testing my buggy software, MiNT will NOT crash. MiNT offers one thing that MagiC doesn't, consistency.

The fact is that now that I have MiNT installed PROPERLY on my Falcon and TT I can't help but to observe that it is ROCK SOLID. As much so as Linux, even without memory protection. Perhaps it is a system that was programmed better, who knows. I'm the first one to tell you I used to be a real MagiC zealot.

MagiCMac and MagiCPC are a bit more stable imho then MagiC atari, but I have seen them crash tons of times too. All of the available operating systems for the Atari need work. None of them have the stability of Linux or even Win2k and that's a fact. MiNT however under a much wider variety of conditions is more stable then MagiC under a wide variety of conditions. In MagiC's defense, it's prettier, has a better desktop and AES, is written in pure ASM, is much faster (and before anyone else can start arguing me, AES and DISPLAY is faster, and contrary to popular belief, that's what REALLY MATTERS!, who cares if MiNT will multitask 12 programs better if I can't load one with MiNT on my STe? ;) I'll care when my CT60 arrives some year.) People swear at Magx on their Falcons, but on mine I can seriously get it to run stable as can be for weeks on end. But there are times when I can just NOT keep the system running, and you know what. I switch to MiNT then and my nerves are calmed.

The TT however crashes maybe once in every 2 months with MagiC. Of course I don't DO anything on the TT and when I DO it crashes ;-).

The fact is, that for ST series limited to 4 megs of RAM, MagiC is the only solution as MiNT is useless and slow. Even on my Falcon I tend to stick to console stuff under MiNT because AES stuff is just sluggish. Regardless, MiNT doesn't use an absurd amount of ram to get a full *nix system running. It's just that we are absurdly limited because of our 4 meg limit. How many PC's do you know of that can run Windows 95 on 4 megs of RAM. A full MiNT system is probably a bit better then early versions of Windows 95 when setup with everything.

Now, I would appreciate if you would retreat to your cubby hole and shut YOUR trap. Why? I run an Atari news portal, it may not be great or heavily trafficked, but I also write articles, am getting involved in several programming projects and unlike you am NOT in denial and understand that MiNT is our BEST prospect. Why? Because I don't think a computer should be forced to stay at 4 megs of ram when we live in TODAY's world.

And lastly. What have you done for Atari lately? Hosted DDP? Great. I don't see you don't ANYTHING except pitching your poor attitude and opinions and slandering other welcome members of the Atari community, nothing. What have you done? I can't find a single project, software, hardware, article, anything. NOTHING to support the community you "hope"

for so much. So if you are going to pitch a rediculous fit, at least be respectful to those who DO want to change the Atari for the better!

Sinclap,
You are a case of hemmroids. Its nasty but theres no other accurate way to describe you but
as a hemmroid on the ass of
humanity.

Perhaps we need a new group:
comp.sys.atari.st.has.4mb.and.i.refuse.to.move.forward

Some people expect to much from these low memory machines. Granted
you can do amazing things in 4mb, but at some point one has to
draw the line. Everybody wants cool apps, cool OS, do stuff like
the big boys, but it just ain't gonna happen in 4mb.

If I had my way, all machines under an 030 and 14mb would be unsupported.

Someday, when I can get my TT030 back working,(needs keyboard) and I want to hook up a modem again, I know it has more than just one ser. port, I have HS Modem on it, would or could I do something to HS Modem to look for a port that I could use something like a 56kb modem on? or is that asking to much?

No big rush, just killing time.

I just got my 1040ST (TOS1.0) reset up and working again.

Ok, here's the scoop.

I picked up a second hand Falcon about a week ago and the owner provided no disks with it. It is pretty much a bog standard Falcon except it has a 200 meg Seagate hard disk.

It is loaded with some misc. software (i.e garbage i have no interest in) and I would like to blank the hard disk and start over fresh. I understand that the OS is in roms (mine has 4.04 i believe), but I have no idea where to start.

Where can I obtain the disks that originally came with the Falcon? I am sure it must have came with some type of utilities or hard disk install disks.

Basically I want to start over fresh to learn the machine and no screw myself after formating the hard disk.

Can anyone help a brotha out?

Thanx!
Todd

Lonny,

Realistically what are you going to do? Writing a lot of software like MiNT and Magx for the ST is like beating a dead horse. The machine has gone as far as it will go for most things because you cannot expand that RAM. What else are you going to do that hasn't been done. You already have Calamus, you already have this and that. But what we don't have is good multitasking and pretty stuff for new machines. That's why we must move forward and the people who refuse to move past a 520ST shouldn't bitch that their archaic hack software doesn't work ;-) That's just the way it is. Funny AtarIRC works fine under MiNT ;-P Bah Humbug... Future .. we don't need no stinkin' future.

Hello,

My TT will reliably do 115200 on Modem2, serial1 and serial2. Modem1 is probably the old ST style port. 56kbps modem transfers at 5.3KB/sec. 115200 is 11.5KB/sec (approximately), so your TT should be able to link with the modem at a speed high enough to use the full abilities of a 56K modem, 57600 or 115200bps.

Enjoy :)

Mark

> why use laser C?

(Pardon me for butting in, and for perhaps veering into something that might be better understood/debated in comp.sys.atari.programmer)

I found that Megamax's Laser C worked about 10x faster than Megamax C in 1990-ish, when running on my then-current setup - a "stack of pizza boxes" Mega 4 (TOS 1.2, or later "disc-loaded RainbowTOS 1.4") connected to a Megafile 60.

It gave me an "all-in-one" environment, and generated reasonable code for the time (no "32k of initialised data accessed relative to address register 4" and "32k of uninitialised data accessed relative to address register 5" limits of Megamax C - all static and global data was accessed using 32-bit absolute addressing, like the Lattice "far" code/data options)

It allowed me to embed 68k assembly language instructions via an "asm { ... }" block, rather than using Lattice C to tediously embed multiple "emit(x)" to add a stream of opcodes/data into the apps instruction stream. (The need to have a separate assembler to generate the code, and then read the disassembled listing to get the opcode, and then embed those into the Latttice code was, and still is, quite a nuisance - especially if your reference book giving the bit layout of 68k opcodes is not close-to-hand)

And it gave me a source-code debugger (something neither Lattice C 5.06 or 5.60 had - Lattice's debugger [Devpac] only allows you to step through assembly language code instruction-by-instruction while watching C source in another "window")

However Laser C failed to run on the TT I bought second-hand in mid-1992. (I tried everything I could think of - I disabled the CPU cache, ran in ST High or ST Medium rez etc - it didn't have any TT ram at the time, so that wasn't an issue)

So I had to do all my writing/coding on the Mega and test the programs on the TT.

And Lattice 5.0 was about 5 times slower than Laser C, so I lost the immediacy of feedback that Laser C gave me.

But Lattice C was an ANSI-standard compiler, whereas Laser was still an older K&R compiler.

(Sorry for the diatribe. We now return you to your "We hate MINT" discussion now in progress)

what do you mean double image?

is it ghosting down the page?? A lighter replication of the start of the page further down the page?

If so, its the wiper blade in the drum kit gone yellow/floppy. If this is the case, and you wish to keep the printer, you will need a new wiper blade fabricated as they're not available anymore, ALthough i think i may be able to get third party ones....

alternativly i have a barley used SLM 605, printer only, which will work with that controller box for sale, if you arent on the other side of the plannet....

IT requires a paper tray, which is the same as that from an Epson EPL 6000..... Drum kits and toner is the same aswell, basicly the same machine...

I wonder if the little board in the SLM 605 that replaces the formatter would fit into other epson printers..... interesting...

The html documentation from this new version has been modified using my little tool that can still be downloaded from http://www.home.zonnet.nl/m.tarenskeen/helpplus-for-mymail.zip

Since the modification is not needed anymore with Erik's new docs, I will remove the tool from my website soon. Please download the new doc's for MyMail from Erik's website when updating to MyMail 1.57.

I've been using an old version for years. Ever since you broke the fonts I
liked to use :)

All in all I have to say that personally I think this thread is one of the
stupidest things to come along in awhile. In general software that works
under Magic works under MiNT as well. There are times where something works
in one and not the other, but hey that's life.

So lets see the general score from the argument so far.

Is magic perfect? No.

Is Mint perfect? No.

Are many atarians willing to spend rediculous amounts of time arguing over
which batch of programmers complaining about dirty hacks is more correct?

Unfortunately Yes.

I believe the question was what was going on in the software development
arena on the platform, not who has the biggest dick.

> the big boys, but it just ain't gonna happen in 4mb.
>
> If I had my way, all machines under an 030 and 14mb would be unsupported.

That would be 97% of the current Atari league without support!!, you may not sell much.

Hi Jared, welcome to CJD club, my name is Steve and I'm a psychopathic alcohol abusing sheep smile restorer.

> I challenge you

You'd soon find out all about hospital food and modern surgery techniques i assure you.

> to actually keep a sentence of mine

OK, I'll have this one.

>intact

Yes thank you, unlike yourself.

>and STILL

Well my fingers are moving, but apart from that yes.

>be able to prove a case against me on a point by point level.

You stand accused of being a child molesting, shit stabbing arsehole faced CJD suffering moron!, how do you plead.

> I doubt you can or would.

Being the judge I've just dismissed the case on the grounds that you are mentally unfit to be tried and herby commit you to years of pink pill popping at the local funny farm.

You will be released on the 5th anniversary of your death or on the day of the successful resurrection of Atari Corp whichever comes last.

> Otherwise known as masturbation!.

Hey, I probably got in a LOT more "HJing" in my ST years, back in the 80's/90's than I'm doing right now with my intererst in Amiga. You just weren't there to know about it. But, then again, you probably weren't even born (or were you hatched? Haven't quite figured that out yet) then yet, either... :-)

I was around when the Atari 2600VCS was a brand new, 6-switch model. Were you? I saw all the different versions. I saw all the different 8-bit Ataris come and go. I saw the transition from Warner Atari to Tramiel Atari. And I saw when Atari was litterly *killed* from the inside out, due to bad business practices and choices made. I saw it all. I have a *REASON* to want Atari back so badly. Do you?

But now, Amiga returns. And Atari is still dead. Go to the following web site and tell me if there are *even* 1,031 Atari users (worldwide, even) that would have paid $50 towards the purchase of a new Atari computer, if Atari was coming back as a hardware company! Somehow, I doubt it...

http://www.amiga-anywhere.com/main.php?PS=1

Says something about the Amiga community, doesn't it? The Amiga spirit never, truely, died. But, then again, neither did Amiga, really.

Jared

>
> SO its not a recent thing for you, being hated and despised?.

It was one user, I believe, that did that. I knew him personally. He did it just because he could. He liked to tick me off. I still kinda like him, even if he hates me. He's just that kinda guy that I can like even if he thinks I'm "a waste of flesh", as he called it. Oh, and just because no one else here has told me what that glitch in the Atari SX212 modem was that caused Michtron BBS to hang, I will now:

+++

Yes, three simple pluses would cause the Atari SX212 to go into command mode (I think that was it) and render it completely "hung" because it (or Michtron BBS) wouldn't ignore that command and/or return the SX212 to answer mode automatically after a set amount of time. The Patriot 2400bps modem I bought afterwards never exhibited this "problem". Besides, it was twice as fast! :-)

> >what was that problem, Mr. Know-It-All? I know, do you?),
>
> Dial in with an Amiga?.

Nope, don't have an external modem to plug into the A1200 and, since DSL is all I have going out to my workshop out in the backyard, I'd need a PCMCIA NIC card to do that and don't currently know which models are supported yet.

> > hence why I never KNEW of that 9600bps limitation nor of the 1999 date

> Like you brain, fudge packer.

You truely have been all too easily beaten down by my superior communicative abilities and argumentative skills and thusly reduced to offering up such a childish reply. And, to think I thought you were an intelligent species...

what species, I still don't know, but I at least I thought you had some intelligence. Guess I can't be right all the time... *sigh*.

What kind of software are you looking for? MIDI software? Graphic
Tools?

As far as starting fresh, all you need do is delete what is there, but
be careful. You don't want to delete the booting programs.!! basically
everything in the Auto-folder you might want to keep.

For FAQ's on Atari stuff, feel free to visit my faq page:

http://tamw.atari-users.net/download.htm

The Atari Quick Faq is a good one. Hallvards pages are good too.

For some of the best MIDI software, most of which works on a Falcon,
visit my main site:

http://tamw.atari-users.net

Hey all,

Lots of stuff over at TAT since the last update! You do you check the
site every few days, right?

There's just way too much new stuff that has been posted since July to
list! But here are some hightlights:

* Quake 3: Adventure! (A new Quake 3 map based on the 2600 game!)
* Bunches of 2600 reviews!)
* JagFest 2K2 Report
* Batman Incarnations by Atari
* Star writer Ethan C. Nobles Profile Atarian!

Did you miss out on a copy of the 2001 Year End Issue? Make sure you get
a copy of the 2002 Issue when it becomes available!

Oops on that one Tim.

You should look for and KEEP a file ending in .SYS, e.g. HDDRIVER.SYS or
AHDI.SYS or ICDBOOT.SYS, which should be in the ROOT of drive C, not the
AUTO folder.

The DESKTOP.INF or NEWDESK.INF should be kept until you know how to install
devices, too.

THINK IT SHOULD BE CHEAPER? MAKE AN OFFER!

1040STe computer bare, add $5 for a mouse, $1 for manual, $1 for power $ 64
cord

1040STf computer bare, add $5 for a mouse, $1 for manual, $1 for power $ 50
cord

1040STf computer bare, needs repair: slight wobble in picture output and $ 23
internal floppy drive is dead, everything else appears fine; fix or use for
parts; add $5 for a mouse, $1 for manual, $1 for power cord

1040STfm computer bare, add $5 for a mouse, $1 for manual, $1 for power $ 57
cord

520ST computer (no DD or PS), bombs & won't boot $ 11

520STf computer no floppy disk drive; incl power supply; add $5 for a $ 13
mouse

520STf computer with DS external disk drive, add $5 for a mouse $ 27

520STfm computer dead internal power supply (looks like it melted down); $ 15
probably repairable or certainly usable for parts; this is the model with
internal DSDD floppy drive and TV output

520STfm computer with internal power supply & DSDD floppy drive and TV $ 15
output; dead floppy drive

BK GFA Basic Michtron manual (only), version unknown, in little 3 ring $ 1
binder, appears to be full but only has pages 316 to 645 + compiler
information (65 pages)

BK INTERMEDIATE and Advanced Atari ST Subjects by Ralph Turner, Turner's $ 1
books are great guides for ST'ers to learn more

BK MANUAL 1040ST original either 86 or 87, good condition $ 2

BK MANUAL TT/ST RAM Expansion Board Manual - install instructions $ 2

BK MANUAL TT030 manual near mint condition original TT manuals $ 4

BK MICHTRON BBS v3.0 manual-only (no disks) $ 1

BK SPACEQUEST 3 Hint book $ 1

BK THIRD Book of Atari ST Topics by Ralph Turner, the series continues $ 1

CABLE 25PIN Modem/serial/printer cable 25 male to 25 female Dsub approx $ 3
8'

CD-ROM SCSI 1X Chinon CDS-435 was working fine but now just ejects disks when inserted, has recent ROM upgrade $ 4

FLOPPY 3.5" Atari external floppy drive, working $ 18

FLOPPY 3.5" Atari external floppy drive; flakey - reads ok sometimes but most of the time doesn't; perhaps fixable; sold as-is, incl working power supply and floppy port cable $ 9

FLOPPY 3.5" Oceanic America Master-3S external floppy drive, incl floppy cable and power supply $ 27

FLOPPY DISKS quantity 10 DSDD namebrand 720k disks pre-used, no guarantee but should work fine $ 1

FLOPPY DISKS quantity 20 DSDD noname 720k disks pre-used, no guarantee but should work fine $ 1

FLOPPY DISKS quantity 7 DSHD noname 1.44M disks pre-used, no guarantee but should work fine $ 1

JAGUAR/STUG T-SHIRTS (ONLY 1 LEFT!!) gorgeous black XLG Fruit-of-the-Loom T-shirts with our Atari club's logo on the front and on the back "Jaguar" in huge red lettering (like on the Jag box) with eerie yellow eyes above it and "64-bit interactive multimedia system" written below, Brand new never worn leftovers from a show we attended $ 7

JOYSTICK Epyx 500XJ joystick - minorly broken, probably fixable or usable for parts $ 1

JOYSTICK Epyx hand conformed joystick $ 3

JOYSTICK sold as set: 2 Wico hand-formed joysticks, 1 in perfect condition, 1 sticks a little $ 1

MAGAZINES great deal! 53 USA Atari mags, 1 Atari disk all together in one super cheap set! email for titles, shipping not included $ 3

MODEM EXTERNAL 1200 baud Atari classic, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 3

MODEM EXTERNAL 1200 baud CapeTronic w/builtin AC adapter & volume control, great starter modem for older computers, incl phone cable, serial cable add $5 $ 3

MODEM EXTERNAL 1200 baud Packard Bell, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 3

MODEM EXTERNAL 2400 baud GVC, AC adapter, great starter modem for older computers, incl phone cable, serial cable add $5 $ 10

MONITOR Master switch between color & mono with a flick of a button! $ 3

MONITOR color Atari SC1224 minor problem: the power button switch won't stay pushed in unless you hold it; fix or replace with a switch from Radio Shack; otherwise works perfect with great picture $ 13

MONITOR color Atari various models working $ 26

MONITOR mono Atari 1991 model small, grey made by Quadrant, flakey, $ 17
picture won't sync (wobbly,distorted), maybe fixable

MONITOR mono Atari various models dead $ 8

MONITOR mono Atari various models working $ 24

MOUSE original Atari mouse guaranteed working $ 9

POWER SUPPLY external for 520 ST's $ 13

PRINTER SUPPORT STAND 2 plastic legs to hold printer above paper, best $ 1
with larger dot matrix printers, sturdy smokey-clear plastic

PRINTER SWITCHBOX 25-pin for modems or printers, broken or miswired: does $ 3
strange things

ROLAND D-50 Synthesizer, great condition classic synth, includes MIDI $470
cables

SPECTRE GCR the premiere Macintosh emulator - complete and upgraded with $ 15
ROMS (disk/docs/cable)

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $ 10
clock automatically every time you boot. Incl box, software and hardware.
Suggested retail was $57.95. Brand new. No guarentee on lithium battery
(estimated 10 year lifespan)

SW BALANCE Of Power strategy game; manual needed (disk) $ 1

SW BATMAN game based on 1st movie by Ocean - fun! (disk/docs/box/sticker) $ 2

SW BENTLEY BEAR Magical Math II, educational, published by Atari (disk) $ 1

SW CRACK'ED game published by Atari (disk) $ 1

SW DAC Easy Accounting software 2disk (disk) $ 1

SW DIAMOND BACK 2 great backup program to most any media (disk) $ 1

SW DR.T's Roland D-50 Editor/Librarian, synth also available see below $ 19
(disk/docs)

SW EKG Teaching By mad scientist software educational, EKG parts/ rhythms $ 1
and pathology recognition (disk)

SW EZCALC good spreadsheet (disk/docs) $ 1

SW GDOS original Atari version 2 disks (disk) $ 1

SW GRAMSLAM grammar and style checker, checks for 1200 errors, can run as $ 1
an ACC or PRG, works with all word processors (disk/docs)

SW IMAGE CAT complete graphics cataloging system for all Atari ST $ 1
computers (disk/docs)

SW INTERLINK ST packaging/box only (no disk, no docs), beautfiul black $ 1
plastic videotape style box with the company logo all over; slides into a
white Interlink box

SW LEISURE SUIT LARRY 2(?) Looking for Love, classic sleazy fun $ 2
w/pixelated nudity by Sierra (disk/docs/box)

SW LEMMINGS Oh No! More Lemmings - great puzzle game by Psygnosis (disk) $ 1

SW LIVRE Du Graphisme (disk) $ 1

SW MACRO Mouse by Antic, record mouse actions (disk) $ 1

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, $ 1
manual for Mergeit only (disk)

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable $ 1
(disk)

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need $ 1
a manual for copy protection (disk)

SW OMEGA strategy game by Origi (disk) $ 1

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual $ 1
for copy protection (disk)

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 1
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 1

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW STALKER 2 older version probably upgradable (disk/docs) $ 1
